
Commonly used for inline protection of fluorescent light fixtures. You'll need both a fuse and fuse holder.

Fuses— Have a built-in cap that securely connects to the fuse holder. Interrupt-current rating is 10,000 amps. UL listed and CSA certified. *LGR fast-acting* fuses protect lighting fixtures. *LMF time-delay* fuses handle high inrush (inducting) loads from ballast transformers in lighting systems.

To Order: Please specify amp rating.

LHR Fuse Holder— For use with LGR and LMF fuses. Rated 10 amps and 300 VAC. It includes two 7″ wire leads. UL recognized.

Fuse Type	Available Amps	VAC		
LGR Fast Acting	1, 1 1/2, 2, 3, 4, 5, 10	300	73405K3	$2.65
LMF Time Delay	1/2, 1, 1 6/10, 2, 3 2/10	300	73405K5	7.19
LHR Fuse Holder			73405K11	2.63
Optional Panel-Mount Clip for Fuse Holder			73405K12	.93

Lift Truck Fuses

You'll find these fuses on battery-operated lift trucks and other low-voltage equipment.

Fast-acting and ***time-delay fuses*** have an AC/DC interrupt-current rating of 10,000 amps. They're 1 1/8″ dia. except 60-amp fuse is 7/8″ dia. UL recognized.

Very fast-acting fuses have an AC interrupt-current rating of 2,500 amps and a DC interrupt-current rating of 2,700 amps. They're 7/8″ wide and have a blown-fuse indicator. UL recognized up to 400 amps.

To Order: Please specify amp rating where necessary.

Fuse block has stud terminal connections.

For information about fuses, see page 916.

Don't see the fuse you need? Just tell us what you're looking for and we'll get it for you.

Blade-Style Low-Voltage Fuses

Mini *Standard* *Maxi*

Easy to install, these fuses are the industry standard for low-voltage automotive and other electronic applications. UL listed except for fuses with blown-fuse indicator. For fuse blocks and holders, see 9553T on page 953 and 8110K, 5183T, and 8945T on this page.

To Order: Please specify amp rating.

Fast-acting fuses with blown-fuse indicator illuminate when it's time to replace them.

40-fuse kit includes 40 standard fuses and a fuse puller/tester.

180-fuse kit contains an assortment of 135 mini, standard, and maxi blade-style fuses; 45 fast-acting, glass-tube fuses; and three different fuse puller/testers. Furnished in a plastic box.

40-Fuse Kit	7460K89	Each	$25.91
180-Fuse Kit	7460K88	Each	$92.33

Inline Blade-Style Fuse Holders

For Standard Fuse

Close the cap on these fuse holders for protection in harsh environments. All are made of plastic. Holders for *mini* and *standard* fuses have two 4″ leads. Holder for *maxi* fuse has two 6″ leads.

Holders with blown-fuse indicator have a light that illuminates when it's time to replace. Both include a fuse.

Blade-Style Low-Voltage DC Circuit Breakers

4212T1 *4212T3* *4212T4*

Never worry about blown fuses again—replace your type ATC, AF, ATO, and 257 blade-style fuses with these circuit breakers. They protect against overload and short circuits in low-voltage automotive and other electronic applications. Interrupt-current rating is 2,000 amps. Temperature range is –40° to +185° F. Meet SAE standards.

To Order: Please specify amp rating.

Available Amps	VDC		
With Automatic Reset			
6, 8, 10, 15, 20, 25, 30	12	4212T1	$23.18
With Push-to-Reset Button

Blade-Style AC/DC Circuit Breakers and DIN-Rail Mount Holder

In addition to replacing type ATC, AF, ATO, and 257 blade-style fuses, this circuit breaker can also be used in AC applications. Compact size allows DIN-rail mounting. It protects against overload and short circuits in low-voltage automotive and other electronic applications. Push the button to reset. Max. voltage is 250 VAC/72 VDC. DC and AC interrupt-current rating is 2,000 amps. Temp. range is –4° to +140° F. UL recognized, CSA certified, and IP40 rated. Meet UL 1077 for branch protection. **To Order:** Please specify amp rating.

DIN-rail mount holder has screw clamp connections.

Available Amps		
¼, ½, 1, 1½, 2, 2½, 3, 4, 5, 6, 8, 10	6493T1	$25.84
DIN-Rail Mount Holder	6493T3	22.34

Blade-Style Fuse Blocks

For Standard Fuses

For Maxi Fuse

An insulating cover prevents contact with live circuits. Blocks have screw terminal connections. Rated 32 VDC.

For Standard Fuses— Maximum 30 amps per fuse; maximum 100 amps per block. Mounting holes are 3/32″ dia.

For Maxi Fuse— 30 to 80 amps. Mounting holes are 3/16″ dia.

Time-Delay Low-Voltage Fuses and Fuse Blocks

Fuse *Fuse Block*

An alternative to blade-style fuses, these fuses are designed for low-voltage automotive and other electronic applications. Interrupt-current rating is 1,000 amps for 50- and 80-amp fuses and 2,000 amps for 40-amp and 100- to 250-amp fuses.

To Order: Please specify amp rating.

Fuse blocks have stud terminal connections and include a protective cover.

♦ Prices are 10% lower when you buy in quantities of 10 or more.

Load-Center Circuit Breakers

Cutler-Hammer

Siemens

Square D Equivalent

Fit these breakers in Cutler-Hammer, Siemens, and Square D breaker boxes. All have screw clamp connections. Rated 120/240 VAC, 60 Hz. Interrupt-current rating is 10,000 amps. Meet UL 489 requirements for branch circuit protection.

Cutler-Hammer CH Series—Plug into Cutler-Hammer CH series breaker boxes.

Siemens QP Series—Plug into Siemens EQ series breaker boxes.

Square D QO Series Equivalent—Plug into Square D QO series breaker boxes (see 6790K on this page).

To Order: Please specify amp rating where necessary.

Plug-Base Fuses and Breakers

Fuses

Rated 125 VAC. UL listed.

Type TL is a time-delay fuse for normal motor applications.

Type T is a time-delay fuse that has more delay than normal. It's commonly used in motor applications when the motor is cycled on/off frequently.

Type S is a time-delay fuse with a non-interchangeable body, which prevents the wrong size fuse from being used.

Type W is a fast-acting fuse for general purpose circuit protection. It quickly opens when short-circuited or when an overload occurs.

Type TL

Type S

Fuse Type	Edison Base	Pkg. Qty.	*15 Amps*	*20 Amps*	*30 Amps*	Pkg.

Square D Circuit Breakers

QO

QOB

Homeline Tandem

Use these breakers with Square D breaker boxes. All have screw clamp connections. Rated 120/240 VAC except 3-pole breaker is rated 240 VAC. Operate at 60 Hz. Interrupt-current rating is 10,000 amps. Meet UL 489 requirements for branch circuit protection. 6782K11 and 69225K2 15- to 20-amp breakers are UL listed as SWD (switching duty) for 120 VAC fluorescent lighting.

QO and ***QOB Series***—QO series plug into Square D QO series breaker boxes (see 6790K on this page). QOB series bolt onto lighting and appliance panel boards.

Homeline Series—Snap into Square D Homeline series breaker boxes (see 6914K on this page). *1-pole tandem* can only be used with the 6914K33 box.

To Order: Please specify amp rating where necessary.

Square D Circuit Breaker Boxes

Also known as load centers, these boxes are single-phase, 3-wire, and can be mounted for top or bottom feed conduit connections. UL listed.

QO Series Main Box

Main circuit breaker boxes have a main circuit breaker switch and main service knockouts in the corners. Enclosures have a hinged door and can be flush or surface mounted. Rated NEMA 1 for indoor use.

Secondary circuit breaker boxes are used as add-on boxes that connect to a main box. They do not have a main circuit breaker switch. Enclosures can be surface mounted, have a screw-on cover, and are rated NEMA 1 for indoor use except 6790K69 has a hinged cover and is rated NEMA 3R for outdoor use.

QO Series—Use with QO series circuit breakers (see 6782K and 5259T on this page). All have a one-piece tin-plated copper bus. Rated 120/240 VAC, 60 Hz. *Main* boxes have an interrupt-current rating of 22,000 amps; *secondary* boxes have an interrupt-current rating of 10,000 amps except 6790K59 is rated 65,000 amps when used with 65,000-amp interrupt-current rated circuit breakers.

Homeline Series—Use with Homeline series circuit breakers (see 69225K on this page). It has a one-piece plated aluminum bus. Interrupt-current rating is 10,000 amps. Rated 120/240 VAC, 50/60 Hz.

Space-Saver Branch Circuit Breakers

The smallest UL 489-rated breakers you can get, these provide branch circuit protection when space is at a premium. They have 0.25″ quick-disconnect terminals, push-to-reset button, and a ⅜″-27 bushing with hex nut for mounting in a 0.38″ dia. panel cutout. Depth behind panel is 1.43″. Rated 120 VAC, 50/60 Hz. Interrupt-current rating is 5,000 amps. Temperature range is 32° to 140° F. UL listed and CSA certified.

No. of Poles	Amps		
1	15	**3851K11**	$13.62
1	20	**3851K12**	13.62

DIN-Rail Mount Circuit Breakers

1 Pole

Mount directly on 35 mm DIN rail. All are thermal magnetic, which means they use the heat generated in overcurrent situations to trip the breaker and have a time-delay feature to prevent tripping on harmless temporary overload currents. Breakers have screw clamp connections and operate at 50/60 Hz. CSA certified. *1-pole breakers* are rated 277 VAC. *2-* and *3-pole breakers* are rated 480Y/277 VAC.

Branch Circuit Breakers— Meet UL 489 requirements for branch circuit protection. Interrupt-current rating is 10,000 amps.

Equipment Circuit Breakers— Meet UL 1077 requirements for supplemental circuit protection. Use downstream of a branch circuit breaker. Interrupt-current rating is 5,000 amps. CE approved.

Standard inrush current breakers are good for most small transformers and pilot device applications. Temperature range is –40° to +167° F.

High inrush current breakers handle motor and larger transformer applications. Temperature range is 23° to 104° F. Meet IEC standards.

To Order: Please specify amp rating.

Alarm— Includes two sets of auxiliary contacts, one of which signals an audible alarm when the breaker is tripped. Rated 2 amps @ 250 VAC/0.5 amps @ 110 VDC.

7026K25 ..... $26.23

Low-Voltage DC Circuit Breakers

Push-Pull Style

Lever Style

Waterproof Button Style

Designed to withstand the harshest environments, these single-pole circuit breakers have a rugged construction that resists vibration and corrosion. All are thermal, which means they use the heat generated in overcurrent situations to trip the breaker. Use in low-voltage vehicle and electronic applications. All have screw terminal connections.

Push-pull style breakers have a push-and-pull button that can be used as an on/off switch. They have a M12×1 mm bushing with hex nut for mounting in a 0.49″ dia. panel cutout. Depth behind panel is 2.48″. Rated 28 VDC. Interrupt-current rating is 6,000 amps. Temperature range is –67° to +167° F. UL recognized.

Lever style and ***waterproof button style*** breakers are a good choice for marine environments and other areas exposed to moisture. CE approved. *Lever style* can also be used as an on/off switch and have 3/16″ dia. mounting holes (screws not included). IP66 rated for protection from power jets of water. Temp. range is –40° to +185° F. Rated 48 VDC. Interrupt-current rating is 5,000 amps. *Waterproof button style* are IP67 rated for protection against water submersion and have 1/4″ dia. mounting holes (screws not included). Temp. range is –25° to +180° F. Rated 42 VDC. Interrupt-current rating is 3,000 amps.

To Order: Please specify amp rating.

High-Temperature Circuit Breakers

Screw Terminals

Quick-Disconnect Terminals

Unlike thermal magnetic breakers, these magnetic breakers are unaffected by ambient temperature changes. They trip when the magnetic field in the coil increases from current overload. Because heat won't affect operation, they're perfect for protecting equipment in areas where ambient heat is a factor. Temperature range is –40° to +185° F. All have 6-32 threaded holes on the front. Operate at 50/60 Hz. UL recognized.

With Screw Terminals— Rated 250 VAC. Interrupt-current rating is 3,000 amps. 72015K3 is also rated for 80 VDC. *1-pole* breakers mount in a 1.45″ Ht.×0.76″ Wd. panel cutout. *2-pole* breaker mounts in a 1.45″ Ht.×1.53″ Wd. panel cutout.

With Quick-Disconnect Terminals— Great for tight spaces, all have 0.25″ quick-disconnect terminals. Rated 277 VAC/80 VDC. AC interrupt-current rating is 5,000 amps. DC interrupt-current rating is 7,500 amps. Mount in 0.63″ dia. panel cutout, one cutout for each pole.

To Order: Please specify amp rating.

Panel-Mount Circuit Breakers

Rocker Style

Push-Button Style

Toggle Style

In addition to providing supplemental protection for your equipment, these circuit breakers can also be used as on/off switches. All are thermal, which means they use the heat generated in overcurrent situations to trip the breaker. Good for applications with high inrush currents such as motor start-ups and switching surges. All have 0.25″ quick-disconnect terminals. Operate at 50/60 Hz.

Rocker and ***Push-Button Style—*** Mount in a 1.77″ Lg.×0.85″ Wd. panel cutout. Rated 240 VAC or 60 VDC. Interrupt-current rating is 1,000 amps. Temperature range is 14° to 131° F. UL recognized and CSA certified. Meet UL 1077.

Rocker style breakers have a black on/off button. Depth behind panel is 1.89″. The optional *clear plastic cover* provides IP54 protection against limited dust and splashed water.

Push-button style breakers have a green "on" button and a red "off" button. Depth behind panel is 2.32″. The optional *clear plastic cover* provides IP65 protection against dust and low-pressure water and requires a 2.07″ Lg.×1.08″ Wd. panel cutout.

Toggle Style— Have a 1/4″-40 bushing with hex nut for mounting in a 1/4″ dia. panel cutout. Depth behind panel is 2.42″. Rated 250 VAC or 75 VDC. AC interrupt-current rating is 200 amps for 1/20-amp breaker; 1,000 amps for 2/10- to 6-amp breakers; and 2,000 amps for 8- and 10-amp breakers. DC interrupt-current rating is 1,000 amps. Temperature range is –22° to +140° F. UL recognized.

To Order: Please specify amp rating.

GFCI Receptacles

Made of impact-resistant plastic, these receptacles provide ground fault protection and reliable performance in industrial environments. They protect all outlets on the same circuit downline from the installed location and have test and manual reset buttons.

Box Mount—All install in a standard outlet box, can be wired from the back or side, and include a wall plate. UL listed. *Tamper/weather-resistant* receptacles comply with NEC standards to limit access to energized internal components and NEC weather resistance requirements for use in wet or damp locations. CSA certified. *Hospital-grade* receptacles meet UL 498 for hospital grade requirements and have an indicator light.

To Order: Please specify color: brown, ivory, or white.

DIN-Rail Mount—Install on 35 mm DIN rail. Color is black. UL recognized.

Surge Suppressor Outlet Strips

Plastic Housing

Plastic Housing with Coaxial Jacks

Aluminum Housing

EMI Limiting

Bench Mount

Protect multiple devices from power surges with one outlet strip. All have a 14/3 AWG cord, three-prong NEMA 5-15 plug and outlets, on/off switch, and 15-amp circuit breaker, unless noted. Phone jacks are RJ-11. Rated @ 120 VAC and UL listed except Bench-Mount strips are rated @ 125 VAC and are ETL and C-ETL listed.

Plastic Housing with Coaxial Jacks— 7693K86 has four coaxial jacks. 7693K86 has two coaxial jacks as well as LED status indicators. An audible alarm alerts you if strip is damaged and needs replacement.

EMI-Limiting with Aluminum Housing— Have an isolated ground connection to protect computers and other equipment from electromagnetic interference.

Hospital Grade with Steel Housing— Meets UL 498 requirements for plug holding strength.

Bench-Mount with Plastic Housing— Secure to your bench or desktop with included clamp for easy access to outlets. You can also mount them in a 1½″ to 3″ dia. hole anywhere along a bench top and drop the power cord through the hole.

Static Control Straps for Personnel

Dissipate static charges from personnel to protect sensitive electronic equipment from damage.

Wrist Straps

With Straight Cord

With Heavy Duty Hand Clamp

Wrist straps have a cord with a snap at one end and a banana plug at the other and include an alligator clip adapter.

Wrist strap with mat includes an easy-to-carry 24″×24″ conductive green and black vinyl work mat. Cord has a 1-megohm resistor in the snap end.

Disposable wrist strap is good for temporary grounding. It adjusts up to 12″ and has an adhesive back.

Foot Straps

Reusable Shoe Strap

Disposable Heel Strap

Attach to the footwear of personnel walking on a conductive floor.

Reusable shoe strap has an adjustable hook-and-loop strap to fit most shoes.

72555K65 ..... **Each** $9.70

Disposable heel straps have an adhesive back for temporary use in static-control areas. Package quantity is 10.

72555K63 ..... **Pkg.** $9.70

Accessories

Four-Receptacle Ground Station

Wrist Strap Tester

Extra ground cord is straight, 15 ft. long, and has a snap at one end and a ring terminal at the other. Minimum resistance is 1 megohm.

72555K58 ..... $14.40

Four-receptacle ground station has a straight, 10-ft. long cord and four banana receptacles to ground four operators to the same workstation.

72555K66 ..... $16.04

Wrist-strap tester ensures wrist strap is functioning properly before personnel start working. Plug your strap into tester and press the button—one of the three lights will indicate whether the strap is pass, fail low, or fail high. Tester is 3.6″ Ht.×2.6″ Wd.×1″ Dp. and operates on one 9-volt battery (included).

72555K72 ..... $101.25

Static Control Work Surface Mats

Prevent damage to sensitive electronic equipment by controlling static electricity on work surfaces. Mats transfer the static charges from the top of your surface to the ground. They include a grounding snap, grounding cord, and wrist strap (except 40-ft. long mat, which does not include wrist strap). Surface resistivity measures the resistance between two points on the surface of the mat, as well as the resistance to the ground, and should fall between 10^6 and 10^9 ohms/sq. for proper static control.

Vinyl Mats

Mats are single layer and have an easy-to-clean surface.

40-ft. long mat has six heel straps with quick-release buckles and six 15-ft. long grounding cords for use as a floor mat. For wrist straps, see 72555K on this page.

Grounding and Shielding Foam

Sheet

Strip

Flexible and compressible, this foam conducts a current between surfaces to complete a grounding path. It also shields electromagnetic interference (EMI) to protect sensitive electronic equipment. Use to ground printed circuit boards or as an EMI gasket. All have a foam core covered in electrically conductive material. Maximum temperature is 158° F.

Sheets can be used to ground larger electronic components or cut to fit your application. Meet UL 94HF1 for flame resistance.

Strips have an adhesive back. *10″ long* strips meet UL 94HB for flame resistance.

EMI-Reducing Grounding Ribbons

Low resistance at radio frequencies gives this ribbon better electromagnetic interference (EMI) reduction capability than other types of grounding ribbon and braid. It's made of flexible copper, laminated on both sides with polyester film to avoid shorting problems, and has tinned ends with a 3/16″ dia. hole for termination. Good for circuit board applications and tight spaces. Meet UL 94V0 for flame resistance. UL recognized.

Lg.	Wd.	Thick.

Grounding Braid and Ribbon

A more flexible alternative to grounding wire, this braid and ribbon provide low electrical resistance equivalent to the wire size listed below.

Grounding Braid and Ribbon

Braid

Insulated Braid

Braid with Eyelets

Ribbon

Ribbon with Holes

Braid—A flat, tin-plated copper conductor that offers better flexibility than ribbon. *Insulated braid* has green PVC insulation. *Braid with eyelets* have a 1/4″ dia. eyelet every 3″.

Ribbon—Made of tin-plated solid copper with a rolled edge, it's used for bonding cable. *Ribbon with holes* has alternating 3/16″ dia. and 1/4″ dia. holes spaced 1/4″ apart.

	Equivalent Wire Size, AWG	Wd.	Thick.	Available Lengths, ft.		Per Ft.
Braid	14	3/16″	0.04″	5, 10, 25, 50, 100	69925K67	$0.90

48″	4	7/8″	1/16″	69925K13	20.45

High-Flex Grounding Wire

Use this finely stranded, tin-plated copper wire inside control cabinets, tight spaces, and other applications requiring high flexibility.

Grounding Wire

Noninsulated with Eyelets

All are UL listed.

Insulated wire has black PVC insulation; ***insulated wire with eyelets*** has translucent green PVC insulation.

Wire with eyelets has 1/4″ eyelets every 4″ and can be cut to length and mounted without terminating. Good for applications that require ground wire to be looped from ground point to ground point with no breaks.

	Wire Size, AWG	OD	Available Lengths, ft.		Per Ft.
Noninsulated					
Wire	10	0.13″	5, 10, 25, 50, 100	2196K57	$0.81
Wire	6	0.22″	5, 10, 25, 50, 100	2196K51	1.62

Grounding Rods

Threaded Grounding Rod

Coupler

Driving Head

Grounding rods connect an electrical system to a ground. They're made of nickel-plated steel that's heavily plated in copper for high levels of conductivity and good corrosion resistance. *Threaded rods* provide the best connection when joining two rods with a coupler. Rods meet or exceed UL standard 467 and ANSI C33.8.

Couplers are threaded and made of high-strength, corrosion-resistant bronze for permanent, highly conductive connections between two rods. One end is chamfered and the other is tapered for easy driving. ***Driving heads*** are 6″ long and protect rod ends from "mushrooming" when driven into the ground.

Dia.	Lg., ft.		Threaded		Unthreaded

Grounding Blocks and Bars

Grounding Block

Grounding Bar

Grounding blocks are commonly used in cabinets and enclosures to connect multiple ground wires. They're made of copper and have 1/4″-20 threaded holes with set screws and 0.164″ dia. mounting holes (screws not included). UL listed.

Grounding bars let you attach multiple ground wires to one location. They're copper and designed for use as a central ground.

6″ long bar has one 1/4″-20 threaded hole, three 10-32 threaded holes, two 9/32″ dia. unthreaded holes, and plastic mounting brackets.

12″ and ***24″ long bars*** have 7/16″ dia. holes, plastic insulators, and stainless steel mounting brackets. UL listed. *Replacement mounting kit for 12″ and 24″ bars* includes stainless steel mounting brackets, hardware, and insulators.

Electronics rack grounding bar fits 19″ wide electronics racks and includes plastic mounting brackets and hardware.

Grounding Connectors

All are UL listed and CSA certified.

Connectors— Connect one or two grounding wires to steel structures, fence posts, and transformers. They can also tap one or two cables from a bus bar. Made of copper.

Couplers— Join two grounding wires to extend the length of your grounding connection or connect to an existing ground wire. Made of bronze.

Grounding Straps and Clamps

Strap

Pipe Clamp, One Wire

Pipe Clamp, Two Wire

Plate Clamp

All are UL listed.

Straps ground to virtually any size pipe or grounding rod. They include a nut and bolt that accept 14 to 6 AWG ground wire. For best performance, match strap material to pipe material.

Pipe clamps connect ground wire to pipes. *One-wire* clamp is bronze and accepts ground wire up to 2 AWG. *Two-wire* clamps are tinned bronze and accept 6 AWG to 250 MCM ground wire.

Plate clamp connects grounding wire to an existing flat grounding surface, such as the lid of an electric meter box, eliminating the need to drive a new ground rod. Accepts 14 to 6 AWG ground wire.

Straps

Material	Lg.	Fits Actual Pipe OD

About Bonding and Grounding for Static Control

Static electricity can be generated by material processing such as mixing, pouring, pumping, filtering, and agitating. Bonding and grounding equipment and containers can reduce static electricity in your environment and reduce the chance of a static spark igniting flammable vapors. Conductive metal objects such as screens, rims of nonconductive drums, probes, spray nozzles, and high-pressure cleaning equipment can become statically charged.

Bonding systems connect two or more pieces of equipment to keep the same electric potential among them, which prevents static sparking. ***Grounding*** systems electrically connect equipment to ground, which prevents equipment from becoming sufficiently charged to cause a static spark.

When the potential for static electricity problems exists, you should always comply with OSHA requirements as outlined in Section 1910.106 and 1910.107 of the OSHA code. NFPA 77 also provides guidance on static electricity. Flammable liquid dispensing should be performed in accordance with all federal, state, and local laws.

Bonding and Grounding Clamps and Cable

Aluminum Hand Clamp

Hand Clamp with Serrated Jaw

Stainless Steel Hand Clamp

Quick-Release Hand Clamp

C-Clamp

Create a grounding path with these metal clamps and cable to prevent static charge buildup.

Hand Clamps—*Aluminum* clamp has stainless steel points. *Stainless steel* clamp has tungsten carbide points.

Hand Clamp with Serrated Jaw—Has a flat steel-plated jaw to prevent damage to unpainted surfaces, posts, or thin materials.

Quick-Release Hand Clamps—Jaw opens if the cable is pulled. They have stainless steel points and are used to ground vehicles.

C-Clamps—*Bronze* clamp has bronze points. *Galvanized steel* clamps have stainless steel points.

Insulated Coiled Cable—1/8″ dia. galvanized steel with an orange vinyl coating.

Material	Jaw Opening	Accepts Cable Dia.		
Hand Clamps

Bonding and Grounding Cable with Connectors

Cable with Two Connectors

Coiled Cable with Two Connectors

Alligator Clip

Hand Clamp

Terminal

C-Clamp

Large Dia. Pipe Clamp

Small Dia. Pipe Clamp

Quick-Release Hand Clamp

Choose the cable and connector configuration to suit your bonding or grounding requirements.

Cable with three connectors consists of a straight line of cable with a clamp at either end and one in the middle.

Cable is galvanized steel. *Bare* and *insulated cable* are 1/8″ dia. *Insulated cable* has a clear vinyl coating. *Insulated coiled cable* has an orange vinyl coating. *Heavy duty insulated coiled cable* is 3/16″ dia.

Alligator clips are copper. *Hand clamps* are aluminum. *Terminals* are tin-plated copper (except 7610K65-K68 and 6997K55 are galvanized steel). *C-clamps* are galvanized steel. *Large diameter pipe clamps* are plated steel. *Small diameter pipe clamps* are bronze. *Quick-release hand clamp* is aluminum and opens when the cable is pulled.

Also Available: Additional cable lengths for Cable with Two Connectors. For bare and insulated cable, ask for 6955K52; for insulated coiled cable, ask for 6955K53. Specify connector types and length.

Cable with Two Connectors

Coiled Cable with Three Connectors

Bonding and Grounding Reels

Steel Reel with Hand Clamp

Stainless Steel Reel with Hand Clamp

Quick-Release Hand Clamp

Alligator Clip

Conveniently ground equipment with these clamps and cables stored on spring-rewind reels. A locking ratchet holds the cable at any length and releases instantly with a light tug. The spring return automatically retrieves cable and a stop keeps the cable end within reach. Cable is 3/32″ dia. except stainless steel reels have 3/16″ dia. cable.

Alligator clips are zinc-plated steel and hand clamps are aluminum. *Quick-release hand clamp* opens when the cable is pulled.

Constant-tension steel reels allow you to override the ratchet to keep constant tension on the cable. *Y-style cable* consists of two 20-ft. cables that extend from a single 30-ft. cable connected to the reel.

Static Control Cord, Tinsel, and Brushes

Remove static from moving materials on conveyors, printing rolls, and chutes. Mount up to 1/4″ from surface.

Cord

With Magnets

Stretchable and easy to replace, cord is 1/8″ dia. and made of acrylic fibers bonded with copper sulfide. Cut to length and use magnets (sold separately) to mount. Magnet has a center hole for easy threading.

Lg., ft.		
5	2805K1	$16.66
32 1/2	2805K2	59.80
Magnet	5685K31	1.89

Tinsel

More conductive than cord, tinsel has a core of thee solid copper wires twisted together. Overall diameter is 1″. *Attachment kit* includes 20 lugs and springs to mount up to 10 pieces of tinsel.

With Attachment Kit

Lg., ft.		
6	63085T46	$4.52
72	63085T47	20.38
Attachment Kit	63085T48	59.93

Tinsel Bars

Choose these bars for more permanent installations. They're made of rigid anodized aluminum with a replaceable copper-tinsel insert that's 3″ shorter than overall length.

About AC to AC Voltage Transformers

Transformers— An AC to AC transformer typically converts alternating current (AC) from one voltage to another. It can be designed to "step up" (boost or increase) voltage or "step down" (buck or decrease) voltage. Transformers consist of two or more coils. When voltage is sent to the primary coil, it magnetizes the coil's core, inducing a voltage in the secondary coil.

Sensitive Equipment Transformers— Also known as isolating transformers, their primary and secondary coils are electrically isolated from each other. The transformer protects sensitive equipment from any input voltage spikes. They are typically larger and more expensive than transformers with connected primary and secondary coils.

High-Inrush Transformers— Also known as control transformers, these are designed for applications with high-inrush loads temporarily exceeding the VA (volt-amps) power output, such as starting and stopping motors. They have electrically isolated primary and secondary coils like sensitive equipment transformers.

Selecting the Right Transformer

1. Determine your input (line) and output (load) voltages and choose a transformer with matching input and output voltages.

2. Determine the power required by the equipment you're running. It's usually listed in kVA (kilovolt-amps) or VA (volt-amps) on the equipment's nameplate.

Choose a transformer with a power output that is equal to or greater than your equipment's power requirements.

For single-phase equipment, use this formula to find VA:

VA = Volts × Amps

For three-phase equipment, use this formula to find VA:

VA = Volts × Amps × 1.73

Sensitive Equipment AC to AC Transformers

Single Phase

Three Phase

Protect your sensitive equipment from input voltage spikes. The cores and coils are sealed to eliminate corrosion and insulation damage. Enclosure is rated UL-3R for indoor and outdoor use except 7131K19-K24 are rated NEMA 3R. Also known as isolating transformers, they have copper wire lead connections except 7131K43-K45, which have a bus bar. Wall mountable except for 7131K42-K45, which are floor mount. Operate on 60 Hz. UL listed and CSA certified except 7131K19-K24 are UL and C-UL listed.

Single-phase constant voltage transformers are used when you need to isolate the input and output voltages without changing their values.

Power-Conditioning Sensitive Equipment AC to AC Transformers

Get protection against three-millisecond power dips and spikes and electromagnetic interference. These transformers also isolate output and input voltage (output regulation is ±3% with input voltage fluctuations from +10% to –20%). They're also known as isolating transformers. All have screw terminal connections, are wall or floor mountable, and operate on 60 Hz. UL listed and CSA certified.

240	120/240	5,000	13″	5.5″	5.1″	7029K47	581.97

For information about AC to AC transformers, see page 934.

For single-phase equipment, use this formula to find power output: **VA = Volts × Amps**
For three-phase equipment, use this formula to find power output: **VA = Volts × Amps × 1.73**

Step-Down AC to AC Transformers with Outlet

Powering a 115 VAC device on a 240 VAC system is as easy as plugging it in with these step-down transformers. Also known as auto transformers, they have a NEMA 5-15 three-prong outlet to connect appliances such as air conditioners, power tools, portable or machine tool lighting, fans, and grinders. The coils and cores are sealed to eliminate corrosion and insulation damage. They're wall mountable, operate on 50/60 Hz, and come with a 6-ft. cord (plug not included) for input connection.

Voltage (VAC) Input	Output	Power Output, VA	Ht.	Wd.	Dp.		
200/220/240	115	200	9.2″	3.9″	3.7″	6980K3	$236.27

200/220/240	115	2,000	11.5″	7.8″	7.1″	6980K8	806.74

Step-Up/Step-Down AC to AC Transformers

Improve the efficiency of your equipment and lower operating costs. Wire these step-up/step-down (boost/buck) transformers to step your input voltage up or down by as much as 20% to match the voltage your equipment needs. All have stranded copper lead wires for input/output connections and operate on 60 Hz. Mount them to a wall or floor.

In addition to the VAC input and output, these transformers are labeled with an ***isolation transformer power output***, which is the rating before you wire the transformer to step up or step down power. Transformers become nonisolating transformers (also known as auto transformers) when they are wired to step up or step down the voltage.

To Order: Choose an input/output voltage combination that comes closest to matching your application, then read down that column until you reach the power output (in VA) of the equipment you want to operate. You probably won't find the exact value you need; choose the next highest rating. *Note:* Three-phase applications require two transformers.

Single Phase—Labeled as 120/240 VAC Input and 12/24 VAC Output

	STEP UP (BOOST)					STEP DOWN (BUCK)					Isolation Transformer Power Output		
Input Voltage / Output Voltage	100 / 120	110 / 120	189 / 208	208 / 230	220 / 242	125 / 113	132 / 120	230 / 208	245 / 222	252 / 240			Each

For more information about selecting the proper transformer and wiring it for your needs, go to mcmaster.com and search for **70525KAC**.

High-Inrush AC to AC Transformers

Also known as control transformers, these transformers handle momentary high-inrush currents associated with contactors, solenoids, and relays, as well as protect your sensitive equipment. They meet NEMA standards for voltage regulation and have screw terminal input/output connections. Operate on 50/60 Hz. UL listed and CSA certified.

Transformers with top-mounted fuse block have a built-in input and output fuse block to save panel space. They install quickly with little wiring. UL class CC midget (13/32″ dia.) fuses required for fused operation.

For information about AC to AC transformers, see page 934.

For single-phase equipment, use this formula to find power output: **VA = Volts × Amps**
For three-phase equipment, use this formula to find power output: **VA = Volts × Amps × 1.73**

Harsh Environment High-Inrush AC to AC Transformers

Single Voltage Output

Multiple Voltage Output

Touch-Safe Multiple Voltage Output

Dust, dirt, oil, and moisture won't damage these high-inrush transformers because they have epoxy-encapsulated coils. Also known as control transformers, all have screw terminal input/output connections and four mounting slots. Operate on 50/60 Hz. UL and C-UL listed.

Single voltage output transformers have an output fuse block. All transformers with ***multiple voltage output*** can simultaneously power multiple devices that require different output voltages.

Multiple voltage output transformers have input and output fuse blocks. UL class CC midget (13/32″ dia.) fuses are required for fused operation.

Touch-safe multiple voltage output transformers have plastic covers over the screw terminals to prevent accidental contact with live electrical connections. CE marked.

Touch-Safe High-Inrush AC to AC Transformers

Recessed screw terminals prevent accidental contact with live electrical connections and the electrically isolated coils withstand high-inrush currents. Also known as control transformers, they operate on 50/60 Hz and are UL and C-UL listed and CE marked, unless noted.

Multimount High-Inrush AC to AC Transformers

Mount these high-inrush transformers using the built-in flanges with mounting holes, 1/2″ trade size NPSM (straight threads) male conduit hub, or included 4″×4″ plate. Also known as control transformers, they are often used in heating, ventilation, and air conditioning control circuits. Input and output electrical connections are 8″ wire leads. Operate on 50/60 Hz. UL recognized.

Voltage (VAC) Input	Voltage (VAC) Output	Power Output, VA	Ht.	Wd.	Dp.		
120	24	40	2.4″	2.5″	2.5″	**7708K74**	$13.68

International-Voltage Transformers

Run an American appliance in Europe or a European appliance in the United States by stepping 220 VAC down to 110 VAC or 110 VAC up to 220 VAC. These transformers continuously operate at the rated power output. They have a NEMA 5-15 three-prong plug and outlet and a European two-prong plug adapter and outlet. Operate on 50/60 Hz.

Power Output, VA	Ht.	Wd.	Dp.		
300	3″	4″	6″	**70285K71**	$71.18
500	3.8″	4″	6.5″	**70285K72**	87.55
1,000	5″	6″	9″	**70285K73**	136.64
2,000	6″	7.5″	9.3″	**70285K74**	226.64

For single-phase equipment, use this formula to find power output: **VA = Volts × Amps**
For three-phase equipment, use this formula to find power output: **VA = Volts × Amps × 1.73**

Intermittent-Use International-Voltage Transformers and Plug Adapters

Convert 240 VAC electricity to power 120 VAC devices or 120 VAC electricity to power 240 VAC foreign devices such as radios and battery chargers. These transformers do not convert frequency.

6968K33 and *K35* have a European two-prong plug and a NEMA 1-15 two-prong outlet. Operate on 50 Hz. 6968K36 has a NEMA 1-15 two-prong plug and a European two-prong outlet. Operate on 60 Hz.

Transformer Kit

Transformer kit has a higher power voltage transformer with a 25/1,875 watt selector switch. It's a solid state transformer and not for use with appliances that have electronic circuitry. Kit also includes the plug adapter assortment and a carrying case.

Plug adapter assortment is for use with devices that already have a transformer that can accept foreign voltages. Includes five adapters that allow you to use NEMA 1-15 two-prong plugs with foreign outlets.

	Watts		
240 to 120 VAC Transformer	50	6968K33	$17.42
120 to 240 VAC Transformer	50	6968K36	17.42
240 to 120 VAC Transformer Kit	25/1,875	6968K35	41.62
Plug Adapter Assortment		6968K34	12.85

Plug-In AC to DC and AC to AC Transformers

Power low-voltage devices from an outlet. Also known as AC adapters, these transformers have a NEMA 1-15 two-prong plug, except 5600K19 and K18, which have a NEMA 5-15 three-prong plug. Operate on 60 Hz. UL listed.

120 VAC Input to DC Output

Quickly connect to your device. Transformers have a 5-ft. cord with 2.1 mm ID/5.5 mm OD connector and are a great solution for replacing lost or broken transformers.

Choose a ***center-positive*** or ***center-negative*** output connector. Look for the illustrations below on the transformer you're replacing to determine whether it's center positive or center negative.

Voltage Output	Power Output	Center Positive (− ◯ +)		Center Negative (+ ◯ −)	
With Cord					
4.5 VDC	1,000 mA	70235K21	$9.87	70235K17	$9.87

Variable Voltage Output Transformers

Bench Top

Panel Mount

NEMA 5-15 NEMA 5-20 NEMA 6-15

Turn the dial to adjust the voltage you need within a given range. Also known as variacs, these transformers are often used in laboratories to vary power, heat, speed, or force. Operate on 50/60 Hz and are CSA certified, unless noted.

Bench Top—Have a ventilated steel case, power-on indicator, and 6-ft. power cord. Include a fuse.

Panel Mount—For permanent installation. They have screw terminal input/output connections except 6994K31-K34 and K41, which have 1/4″ quick-disconnect terminals.

AC to DC Transformers

Convert AC input voltage to a constant DC output voltage. These transformers, also known as DC power supplies, have screw terminal input/output connections. UL listed and CE approved.

Single-phase power input transformers have an input voltage of 100-240 VAC and include a mounting bracket. CSA certified.

Three-phase power input transformers have a three-phase input voltage of 360-550 VAC. C-UL listed. 8242K31 mounts to a 35 mm DIN rail. 8242K33 and *K35* are screw mount.

DIN-Rail Mount AC to DC and DC to DC Transformers

Also known as DC power supplies, these transformers conveniently install on a 35 mm DIN rail. An overload protection feature decreases output voltage and automatically resets when the output current returns to the rated range. All have a green LED output indicating light and screw terminal input/output connections.

AC Input— Operate on 50/60 Hz. UL and C-UL listed and CE marked except 7009K11, which is UL listed and CSA certified.

Single phase have an input voltage of 100 to 240 VAC, unless noted. *Three phase* have an input voltage of 340 to 575 VAC, unless noted.

DC Input— Input voltage is 12 to 24 VDC. UL recognized and CSA certified.

★ Input voltage automatically selects from 115/230 VAC.
■ Input voltage is 320 to 540 VAC.

Current-Limiting AC to Adjustable DC Transformers

Single Output Digital Display

Single Output Analog Display

Prevent damage to devices that try to draw too much power. Also known as DC power supplies, these transformers allow you to adjust and limit the DC output current and voltage. All have an on/off switch and 5-ft. cord with NEMA 5-15 three-prong plug. Output connections are binding posts for banana plugs. Operate on 115/230 VAC, 50/60 Hz.

Single Output— 7686K26 has selectable ranges of 0 to 36 VDC and 0 to 18 VDC.

Dual Output— Has two 0 to 30 VDC outputs and can be connected in series or parallel.

Wattage varies depending on your DC output voltage and amperage. To determine the power output required, use the following formula: Watts = Volts × Amps.

DC Output Volts	Amps	Ht.	Wd.	Dp.		
Single Output— *Digital Display*						
0-18	5	5.5″	6.5″	10.4″	**7686K25**	$232.75

AC to Adjustable DC Transformers

0-16 VDC

0-160 VDC

Adjust and monitor the power output of these transformers, also known as DC power supplies.

0 to 16-volt transformer has an analog voltmeter and ammeter for continuous monitoring of output voltage and current. Output connections are binding posts for banana plugs. It has an on/off switch and an 8-ft. cord with NEMA 5-15 three-prong plug. Operates on 117 VAC, 60 Hz.

0 to 160-volt transformer has an on/off switch, cooling fan, 10″ input cord with NEMA 5-15 three-prong plug, and 10″ output cord with NEMA 5-15 outlet. Operates on 120 VAC, 60 Hz.

Wattage varies depending on your DC output voltage. To determine the power output required, use the following formula: Watts = Volts × Amps.

DC Output Volts	Amps	Ht.	Wd.	Dp.		
0-16	5	10.8″	4.8″	6.5″	**6972K11**	$518.75
0-160	10	13″	13.8″	8″	**6974K11**	1,540.00

DC to AC Voltage Transformers

Compact

General Purpose (with Cigarette Lighter Plug)

For Motor Loads (with Screw Terminals)

For Sensitive Electronic Loads

Use a DC battery to power devices that run on AC voltage. Also known as inverters or converters, these transformers provide overload protection and an output frequency of 60 Hz. All have a three-prong AC outlet.

Compact— Has a cigarette lighter plug input, input short circuit protection, low battery shutdown, and a USB charging port.

General Purpose— Good for portable computers and battery chargers. 6987K22 and *K35* have a cigarette lighter plug input. K22 also includes a battery cable with clips. 6987K29, *K42*, and *K23* have screw terminal input connections.

For Motor Loads— Provide AC power to devices that temporarily draw high output, such as motors. Transformers are designed to withstand starting surges up to twice the power output rating and they maintain a 60 Hz frequency, ±1 Hz (except 6987K91 is ±0.3 Hz). 76815K85 has a cigarette lighter plug input; 6987K91 has screw terminal input connections.

For Sensitive Electronic Loads— Produce AC output that most closely resembles clean, stable AC-generated power at 60 Hz. Transformers prevent damage from overloads, short circuits, and overheating. Input connections: 70555K11 has a cigarette lighter plug; *K13-K14* have 5/16″ stud terminals; and *K17* has wire leads.

Single-Phase to Three-Phase Voltage Transformers

Also known as phase converters, these transformers generate three-phase 220 VAC output power from a single-phase 220 VAC input. Operate on 50/60 Hz.

(A) Light Load— Also known as static converters, they are often used for drill presses, mills, and grinders and are a low-cost alternative to our high-efficiency transformers. They are designed to allow your motor to run at up to 70% of its normal power. All come with a terminal block for connections and are wall mountable.

Note: Select a transformer so the power output of your largest motor falls within the output range. When using multiple motors, start the largest motor first, then start smaller motors individually.

(B) High-Efficiency Light Load— Also known as rotary converters, these allow motors to run at 100% of their normal power. They include leads for hardwiring and are floor mountable.

Note: Select a transformer with a power output that exceeds but comes closest to the power requirement of your largest motor. When using multiple motors, start the largest motor first. Then start smaller motors individually until their total hp requirement is no more than twice the power output of the transformer.

(C) High-Efficiency Medium-to-Heavy Load— Similar to Style B, but they allow the total hp requirement of your motors to be three times the power output of the transformer. Used in gear head lathes and flywheel and hydraulic applications. All have leads for hardwiring and are floor mountable.

Uninterruptible Power Supplies

NEMA 5-15

NEMA 5-20

Protect sensitive and critical electronic equipment with uninterruptible power supplies (UPS). They provide the same protection as Backup Power Supplies but without any power loss when switching to battery power during an outage. These units handle input voltages from 65 to 138 VAC and provide constant output of 120 VAC (±2%). They also protect against frequency variation and waveform distortion.

Power supplies include a DB9 (serial) port and cable to save data and safely shut down an unattended computer during outages. They have six NEMA outlets. (70485K23 also has a L5-20 outlet.) Use on a desktop or mount in a 19″ wide electronics rack. Meet UL 1778. Choose a power output that is equal to or greater than the power your equipment requires.

Backup Power Supplies

Low Profile

With Power Conditioning

Be ready for brownouts that could damage your equipment and blackouts that shut you down. These products transfer power to a built-in battery with only a momentary power loss during the transfer. They also protect against line noise and power surges. Power supplies include a USB port and cable (except 7530K21) to save data and safely shut down an unattended computer during outage. They have six NEMA 5-15 outlets and a cord with NEMA 5-15 three-prong plug, unless noted. Choose a power output equal to or greater than the power your equipment requires. You can determine your volt-amps requirement by multiplying the amp draw of your equipment by 120 VAC.

Standard— All of the outlets in 7530K36 and K37 have surge suppression; three have battery backup. 7530K36 and K37 also have an RJ-45 phone jack.

Low Profile— All of the outlets in these compact units have surge protection. Three of the outlets in 7530K42 have battery backup as well as four of the outlets in 7530K43 and six of the outlets in K44. All units have an RJ-11 phone jack.

With Power Conditioning— During power dips and surges, these units raise or lower power to keep it at a normal level. There is no battery transfer time during a power dip. All of the outlets in 70475K11 and K12 have surge suppression; three have battery backup. 70475K11 has an RJ-11 phone jack. 70475K17 and K12 have an RJ-45 phone jack.

Power Conditioners

General Purpose

Premium

Regulate power dips and surges to protect sensitive equipment. Power conditioners take AC power input and provide a constant output power level. They have NEMA 5-15 outlets and a cord with NEMA 5-15 three-prong plug. Choose a power output that is equal to or greater than the power your equipment requires. You can determine your volt-amp requirement by multiplying the amp draw of your equipment by 120 VAC.

General purpose and ***rack-mount*** units handle input voltages from 89 to 147 VAC and provide a constant output voltage of 120 VAC (±9%).

General purpose units have a 6-ft. cord. UL and C-UL listed, except 7596K56. ***Rack-mount*** unit fits in 19″ wide electronics racks. Cord is 12 ft. long.

Premium units handle input voltages from 96 to 132 VAC and provide a constant output voltage of 120 VAC (±5%). They also provide greater electromagnetic interference and line noise suppression. Cord is 6 ft. long. UL listed and CSA certified.

About Electrical Testing

Here are factors to consider when selecting a testing meter:

Single Function or Multifunction: Choose a multimeter if you need to test or measure multiple electrical properties.

Multimeters or Clamp-On Multimeters: Multimeters require the circuit to be cut for measuring current. Clamp-on multimeters clamp around a single insulated conductor, making them safer and more convenient for frequent measurements.

Average Sensing or True RMS (Root Mean Square): Average sensing meters accurately measure AC voltage and current that follow a sine wave. True RMS meters accurately measure AC voltage and current regardless of the sine wave shape. This is important because many electronic devices, including computers and adjustable-speed drives, draw current in short pulses that can distort the shape of the wave.

DC Accuracy: Many multimeters measure AC/DC voltage and current, resistance, capacitance, and frequency, each of which is rated for accuracy. For multimeters, we list basic DC voltage accuracy because it is the truest measure of accuracy.

IEC 61010 Safety Categories: The International Electrotechnical Commission (IEC) defines categories for rating the safety of electrical testing instruments. The higher the category (CAT), the closer the equipment being tested can be to the utility power source. A meter can have multiple category ratings. Our catalog lists the highest category rating. See safety category descriptions below:

Safety Category	Voltage Category	Transient Overvoltage Protection Capability	Where to Use	Applications
CAT IV	600V	8,000V	Three-phase at utility connection, any outdoor conductors.	Outdoor overhead and underground cable runs, electricity meters, primary breakers, and fuses.
	1,000V	12,000V		
CAT III	300V	4,000V	Distribution circuits, including single-phase commercial lighting.	Switchgear and three-phase motors; transformers and distribution panels; bus, feeder, and short branch circuits.
	600V	6,000V		
	1,000V	8,000V		
CAT II	300V	2,500V	Single-phase receptacle-connected loads.	Appliances, portable tools, and most 120V or 240V equipment inside a building; outlet receptacles and long branch circuits.
	600V	4,000V		

Fluke Digital Multimeters

Fluke meters are known for quality and durability. Use to measure AC/DC voltage, AC/DC current (unless stated otherwise), and resistance. Meters are autoranging and have an audible signal to indicate continuity. All have data hold and an easy-to-read back-lit LCD, unless noted. Include test leads and batteries.

Meters with certificate of calibration have a NIST (National Institute of Standards and Technology) certificate.

True RMS multimeters give the most accurate AC measurements.

For detailed specifications, go to mcmaster.com and search for **7093KAC**.

Multimeters, Styles A-G

Meters have a min./max. mode and perform diode testing. They can measure capacitance, unless stated otherwise. UL listed and CSA certified, except for Style A and Style E meters, which are CSA certified to U.S. and Canadian standards. All are CE approved.

87-5/E2 kits include a Fluke 87-5 meter, test clips, leads, magnetic meter hanger, and temperature probe. Packed in a carrying case.

117/322 kits include a Fluke 117 meter, Fluke 322 400-amp clamp-on meter, test leads, and a carrying case.

Fluke No.	Style	Features	Safety Cat.	DC Accuracy	Frequency	Meters Each	Meters w/ Certificate of Calibration Each
Average Sensing Multimeters							
27-2	A	Waterproof (IP67) meter that withstands vibration, shock, and extreme temps.	IV, 600V	0.5%	Yes	**7093K1**.....$441.95	**7093K111** ...$547.15
77-4	B	Meter for basic troubleshooting.	IV, 600V	0.3%	Yes	**7093K82**.....$269.95	**7093K84**.....$340.93
83-5	C	Higher accuracy for troubleshooting machines and power distribution.	IV, 600V	0.1%	Yes	**7093K53**.....$389.95	**7093K531** ...$493.89
True RMS Multimeters							
28-2	A	Waterproof (IP67) meter that withstands vibration, shock, and extreme temps.	IV, 600V	0.5%	Yes	**7093K2**.....$451.95	**7093K211** ...$557.15
87-5	C	High accuracy and filter for troubleshooting motor drives and controls.	IV, 600V	0.05%	Yes	**7093K75**.....$399.95	**7093K551** ...$505.15
87-5/E2 Kit	C	Includes temp. probe, magnetic hanger, and test clips.	IV, 600V	0.05%	Yes	**7093K86**.....$451.95	**7093K651** ...$557.15
114	D	For electrical troubleshooting. Does not measure current or capacitance.	III, 600V	0.5%	No	**7093K753** ..$140.95	**7093K754** ...$206.86
115	D	Meter for basic troubleshooting.	III, 600V	0.5%	Yes	**7093K755** ..$167.95	**7093K756** ...$233.86
116	D	Measures microamps for HVAC troubleshooting, includes temp. probe.	III, 600V	0.5%	Yes	**7093K751** ..$194.95	**7093K752** ...$260.86
117	D	Noncontact AC voltage detector.	III, 600V	0.5%	Yes	**7093K761** ..$205.95	**7093K762** ...$271.86
117/322 Kit	D	Includes Fluke 322 clamp-on meter.	III, 600V	0.5%	Yes	**7093K763** ..$327.72	**7093K764** ...$418.67
175	B	Accurate meter. LCD not back-lit.	IV, 600V	0.15%	Yes	**7093K19**.....$259.95	**7093K191** ...$330.93
177	B	Higher accuracy for troubleshooting machines and power distribution.	IV, 600V	0.09%	Yes	**7093K22**.....$269.95	**7093K222** ...$340.93
179	B	Same as Fluke 177 meter, plus temp. probe.	IV, 600V	0.09%	Yes	**7093K23**.....$280.95	**7093K231** ...$351.93

Repl. Fuses for All Meters—11 Amps	DMM-B-11A	4398K2	7.83

Open-Jaw and Clamp-On Multimeters, Styles H-L

No more fumbling with leads; measure current by surrounding a single insulated conductor with the jaws of these meters. They have a back-lit LCD except Styles H and J, which are not backlit. UL listed and CSA certified, except for Style L meters, which are CSA certified to U.S. and Canadian standards. All are CE approved.

Meters ***with peak hold*** are useful for troubleshooting because they store your highest current measurement. ***Average sensing clamp-on*** and ***True RMS clamp-on multimeters*** come with a carrying case.

Fluke No.	Style	Features	Jaw Opening	Safety Cat.	DC Accuracy	Frequency	Peak Hold	Each
Open-Jaw Multimeters								
T5-600	***H***	Measures AC current up to 100 amps and voltage up to 600V.	0.5″	III, 600V	1%	No	No	7053K31 $104.95
T5-1000	***H***	Measures AC current up to 100 amps and voltage up to 1000V.	0.5″	III, 1000V	1%	No	No	7053K32 $142.95
Average Sensing Clamp-On Multimeters

Fabric Holster for Open-Jaw Meters	H5	7053K14	$44.95
Leather Case for Open-Jaw Meters	C520A	7053K15	18.95

Fluke Scopemeter

Analyze voltage with this combination dual-channel 20 MHz oscilloscope and True RMS recording multimeter. It's useful when installing machinery and instrumentation as well as control and power systems. Meter is autoranging and can trace problems from nanoseconds up to 16 days, making it easier to troubleshoot intermittent faults. It has an easy-to-read digital back-lit LCD. AC/DC voltage: 600. DC voltage accuracy: ±0.5%. Max. resistance: 30 MΩ. Max. frequency: 20 MHz. Max. capacitance: 500 µF.

Includes a rechargeable battery pack for up to seven hours of use, an AC adapter/charger, shielded test leads, alligator and hook clips, and a shielded BNC adapter. UL listed; CSA certified; and CAT III, 600V safety rated.

Accessory kit includes an RS-232 adapter/cable for connecting to a printer or PC, software for analyzing and storing measurements, and a hard case.

	Fluke No.		Each
Scopemeter	123	6587K11	$1,406.95
Accessory Kit	SCC120E	6587K21	350.95
Repl. Test Leads	STL-120	6587K32	120.00
Nylon Case	C789	71915K72	107.95

Pro-Value Digital Multimeters

7613K5 7420K43 5189T11 7420K54 7508K61 7508K12

A good budget-conscious choice, these high-quality meters measure AC/DC voltage, AC/DC current (unless stated otherwise), resistance, and capacitance (unless noted). An audible signal indicates continuity. Meters are autoranging and have data hold and an easy-to-read back-lit LCD, unless noted. For current-sensing clamp-on test leads, see page 946.

True RMS multimeters give the most accurate AC measurements.

For detailed specifications, go to mcmaster.com and search for **7420KAC**.

Multimeters

In addition to the features described above, these meters perform diode testing. Furnished with test leads and batteries. UL listed, except for 7420K52, 7574K41, and 6394K11. 7420K42 is also C-UL listed. 7420K52 and 7574K41 are CSA certified to U.S. and Canadian standards. All are CE approved.

Meters ***with min./max. mode*** store minimum and maximum measured values that aid in troubleshooting.

Features	Safety Cat.	DC Accuracy	Frequency	Min./ Max. Mode	Multimeters	Each	Repl. Test Leads	Each

● Does not measure capacitance. LCD not back-lit. ♦ Does not have data hold. ■ Not autoranging.
★ LCD not back-lit. ▲ Does not measure capacitance.

Clamp-On Multimeters

Measure current without using leads or interrupting the circuit—just clamp the meter around a single insulated conductor. Meters come with test leads, batteries, and a carrying case. UL and C-UL listed, except 7508K13, which is ETL and C-ETL listed. All are CE approved.

Meters ***with peak hold*** are useful for troubleshooting because they store the highest current measurement. ***Average sensing multimeters*** measure VAC current. ***True RMS multimeters*** measure both VAC and VDC current.

Features	Jaw Opening	Safety Cat.	DC Accuracy	Frequency	Peak Hold	Clamp-On Multimeters	Each	Repl. Test Leads	Each

Pocket Digital Multimeters

7613K1

Pop these average sensing meters into your pocket for go-anywhere convenience. An audible signal indicates continuity. All are autoranging and have an easy-to-read LCD. 7613K81 and K9 meters perform diode testing. 7613K81 has data hold. 7613K1 and K9 have a built-in noncontact voltage detector. Furnished with test leads, a battery, and a carrying case. 7613K1 and K9 are UL listed and CSA certified. All are CE approved.

Safety Cat.	AC/DC Voltage	DC Accuracy	Current, mA AC	Current, mA DC	Max. Resistance	Max. Frequency	Max. Capacitance	Ht. × Wd. × Dp.		Each
II, 600V	500	1.3%	400	400	40 MΩ	10 MHz	100 µF	4¼″ × 2¼″ × ½″	7613K81	$39.97

For information about electrical testing, see page 940.

Pro-Value Analog Multimeters

See your readings on a bold, easy-to-read three-color analog scale. Meters provide overload protection and work well for most everyday voltage, current, and resistance testing. Furnished with test leads and batteries. CE approved.

7097K31 is UL and C-UL listed and CAT II, 500V safety rated. 7097K32 performs battery and transistor tests.

7097K31 7097K32

AC/DC Voltage	DC Accuracy	Sensitivity, kΩ/V AC	Sensitivity, kΩ/V DC	DC Current	Max. Resistance	Meters	Each	Repl. Test Leads	Each
500	4%	2	2	250 mA	1 MΩ	7097K31	$16.99	7508K66	$9.58
1200	3%	9	20	12 A	20 MΩ	7097K32	43.71	7097K29	29.75

Heavy Duty Analog Multimeters

Rugged and reliable, these analog multimeters set the standard for all others. DC accuracy: 2% of full scale. DC current: 10 A. All meters include test leads with screw-on alligator clips and batteries. ***Meters with overload protection*** have a resettable overload circuit protection relay.

Standard— Have a three-color scale. Padded, soft carrying cases are sold separately. *Black* meters have a phenolic housing. *Yellow* meters have an ABS plastic housing and an audible signal to indicate continuity.

Safety Rated— Have an ABS plastic housing and a two-color scale. Furnished with a padded, soft carrying case. EN 61010-1, Cat. III, 600V safety rated. ETL and C-ETL listed.

7250K11

Yellow Carrying Case for 7250K13 and K16 ..... 7250K4 **Each** $64.29

Clamp-On Analog Multimeter

Just clamp this analog meter around a single insulated conductor to measure current without interrupting the circuit. Meter also measures AC/DC voltage and resistance. It has data hold and an easy-to-read two-color scale. Furnished with test leads. Meter requires one AA battery (sold separately). ETL and C-ETL listed.

Jaw opening is 1½″. AC current: 600 A. AC voltage: 600. DC voltage: 60. Max. resistance: 1 kΩ. Operating frequency: 60 Hz. Accuracy: ±5%.

Multimeter ..... 7615K57 **Each** $85.37

AA Batteries (4/Pkg.) ..... 71455K53 **Per Pkg.** $2.94

Electronic-Component Multimeters

Standard

Perform a full-range of capacitance, resistance, and diode testing on your electronic components. An audible signal indicates continuity. Meters have a digital LCD and come with test leads and a battery. CE approved.

Standard— Has a zero adjustment for both capacitance and low ohms range. Capacitance (7 ranges): 200 pF-20 mF. Resistance (7 ranges): 20 Ω-20 MΩ.

Deluxe— Also measures inductance and NPN/PNP transistor gain; great for checking inductors, transistors, and microwave diodes. Capacitance (8 ranges): 200 pF-2000 µF. Resistance (7 ranges): 20 Ω-20 MΩ. Inductance (7 ranges): 200 µH-200 H.

	Meters	Each	Repl. Test Leads	Each
Standard	7620K37	$89.81	7420K57	$16.95
Deluxe	7620K38	195.91	7420K55	11.95

Digital Oscilloscope

Analyze waveforms with this dual-channel 25 MHz oscilloscope. It has 20 automatic voltage and time measurements, a TFT color LCD, and a 6-ft. cord with three-prong plug.

Sample rate: 500 MSa/s. Rise time: <14 ns. Vertical sensitivity: 2 mV-5 V/div. Voltage range: Up to 400 VAC/VDC. DC accuracy: 3%. Operating voltage range: 100-240 VAC.

Comes with a 10:1 two-piece probe set, a USB cable, and PC software (compatible with Windows 98, NT, 2000, XP, and 32-bit Vista). CE approved and CAT II, 300V safety rated.

6584K1 ..... **Each** $479.81

Voltage and Current Loggers

A&B C D

Troubleshoot intermittent problems, monitor equipment run cycles, and verify power conditions with these easy-to-use, single-phase data loggers. When connected to a PC, they can be used as a real-time sensor with logging capability.

Styles A-D handle up to 240,000 readings. Sampling interval is 125 mS to 24 hours. *Styles A* and *C* loggers are True RMS, which means they have more memory for higher-accuracy applications with large amounts of data. All are furnished with batteries, a USB cord, and software compatible with Windows 2000, XP, and Vista. CE approved (unless noted). *Styles C* and *D* have a current accuracy of 0.5% and require a clamp-on probe (sold separately). *Styles A-C* include leads with alligator clips. ***Clamp-on probe for Styles C and D*** has a jaw opening of 0.8″. Current ranges: 0.1-24 A with 1% accuracy and 0.5-240 A with 3% accuracy. UL and C-UL listed; CE approved; and CAT IV, 300V safety rated.

Style E takes up to 10,750 readings. It can store up to 21,500 readings if measuring only current or only voltage. Sampling interval: 1 second to 18 hours. Current: 0-300 A. Current accuracy: 5%. Logger has a USB port and includes a clamp-on probe with 1.1″ jaw opening, leads with alligator clips, and a carrying case. Requires a 9V battery and software (each sold separately). Software is compatible with Windows 95 and later.

E

★ Not CE approved.

For information about electrical testing, see page 940.

AC Power Meters and Loggers

Monitor, measure, and project energy costs of your device with True RMS digital measurements of voltage, current, and watts. Voltage range: 100-250 AC. Voltage accuracy: 1.5%.

All operate on 120 VAC, 60 Hz and include a 6-ft. cord with three-prong plug. Just plug your device into the meter to take measurements. Meters have an LCD and a receptacle rated 15 amps @ 120 VAC. Size is 7″ Ht.×4″ Wd.×2″ Dp. UL listed, C-UL listed, and CSA certified (unless noted).

With Data Logger— Meter stores 30,000 readings. Includes a USB cable and software for downloading data to PCs running Windows 98, XP, or Vista.

With Data Logger and Switching Relay— Has a switching relay to turn power on and off to minimize costs. Controls loads based on factors such as time of day, peak usage, and cumulative usage. Meter stores 120,000 readings. You can remotely monitor the meter via an Internet connection. Has an RJ-45 Ethernet jack and a USB port. Furnished with software for downloading data to PCs running Windows 98, XP, or Vista.

		Each
Standard	7382K11	$108.33
With Data Logger	7382K12	149.92
With Data Logger and Switching Relay	7382K13★	246.52

★ Not C-UL listed.

Power Monitor and Analyzer

Monitor

Analyzer

Monitor and track voltage, current, power, and harmonics in single-phase applications. You'll get True RMS measurements of inrush current; min., max., and average volts and amps; crest factor; peak value; and temperature in °F and °C. The monitor and the analyzer also measure watts, VARs, VA, power factor, and displacement power factor. Use the included software to download data to your PC.

Voltage range: 0-660 VAC/VDC. Current range: 2-240 A. Size is 8⅜″ Ht.×4⅜″ Wd.×2½″ Dp. Furnished with current probe, test leads with alligator clips, batteries, charger, PC software (compatible with Windows 2000, XP, and Vista), a USB cable, and a carrying case. CE approved and CAT III, 600V safety rated.

Monitor has a back-lit digital display and stores nine sets of readings. ***Analyzer*** has a color LCD and graphically displays data for analysis without a PC. Stores 2096 events and displays K-factor. Sampling interval is 1 second to 2 hours.

		Each
Monitor	4808K1	$1,093.38
Analyzer	4808K2	1,868.31

Clamp-On Amp Meters

Quickly measure current on single-conductor wires and cables without interrupting your circuit. These average sensing meters have a jaw that opens 1¼″ to measure conductors up to 1″ in diameter. Meters have an easy-to-read digital LCD. 8264T12 is autoranging. Both come with batteries and a carrying case. CE approved and CAT III, 300V safety rated.

Current Accuracy	Current Ranges, Amps	Operating Frequency		Each
2-3%	0-20, 0-200 AC	40 Hz-1 kHz	8264T11	$93.56
1-4%	0-40, 0-300 AC/DC	20 Hz-1 kHz	8264T12	256.67

Fluke Vibrating Voltage Tester

Tester indicates nine levels of AC and DC voltage with three types of signals for extra safety—light, sound, and vibration. Tester also measures resistance, checks continuity, and has a back-lit digital LCD. Detects live voltage even if batteries are depleted. Max. resistance: 10 kΩ. Includes test leads and batteries. UL listed; CSA certified; CE approved; and CAT IV, 600V safety rated.

	Fluke No.	Voltage Range, VAC/VDC		Each
Tester	T+Pro	12-600	7053K16	$80.95
Fabric Holster	H3	—	7053K17	27.95
Leather Case	C520A	—	7053K15	44.95

Multiwire Clamp-On Amp Meter

Forget about splitting and stripping cables. This meter lets you quickly measure current on one-, two-, or three-conductor cables without interrupting your circuit. Meter is autoranging and has an easy-to-read, back-lit digital LCD with low-battery indicator. Maximum jaw opening: 0.51″. Maximum frequency: 400 Hz.

For single-conductor wires and cables, current accuracy is 1.5% and AC current range is 0.1-200 amps. For two- and three-conductor cables, current accuracy is 5% and AC current range is 0.1-100 amps.

Furnished with a battery and carrying case. CE approved and CAT III, 600V safety rated.

7826T12 ..... **Each** $323.17

Vibrating Voltage Testers

In addition to illuminating an indicator light, these testers vibrate to signal the presence of voltage. They also approximate the value of that voltage on an LED scale. Both testers include two 36″ long, oil-resistant test leads with spring-loaded safety shields on the tips. UL listed; CSA certified; and CAT III, 600V safety rated.

Voltage tester does not require batteries. ***Voltage/continuity tester*** has a light to indicate continuity and comes with batteries.

	Voltage Range, VAC/VDC		Each
Voltage Tester	100-600	7258K23	$41.65
Voltage/Continuity Tester	5-600	7258K24	62.46
Nylon Carrying Case		7258K34	23.54
Replacement Test Leads		7258K35	22.17

Voltage Detectors

Test for a hot circuit in outlets, switches, fuses, and other electrical components. An indicator light signals the presence of voltage.

Style A has a slotted screwdriver and checks continuity. Furnished with batteries. ETL and C-ETL listed.

Styles B-D do not require batteries. Style B is ETL and C-ETL listed; CE approved; and CAT I, 50V safety rated.

	Voltage Range	Lead Lg.		Each
Screwdriver Style				
A	12-250 VAC/VDC	—	6982K21	$11.28
Twin-Lead Style				
B	5-50 VAC/VDC	5½″	6982K51	4.70
C	120-480 VAC/160-600 VDC	12″	6982K71	9.04
D	80-600 VAC/VDC	24″	7260K11	24.91

Noncontact High-Voltage Detector

Since this detector senses electrostatic fields, there's no need to make contact with conductors to check for live wires or for breaks in insulated wires and heating elements. Detector has an audible signal to indicate the presence of voltage. Use for checking fuse panels, breaker panels, power outlets, and switches. Furnished with a battery.

The detector has a two-position switch for selecting a 30-1500 VAC or 1500-122,000 VAC range. Use this detector with the optional *hot stick* to extend its reach. Made of PVC, hot stick is 48″ long and collapsible.

		Each
Detector	7440K29	$190.31
Hot Stick	7440K32	125.24

For information about electrical testing, see page 940.

Continuity Detectors

Search out breaks and shorts in electrical circuits. *Note:* Turn off the power to your circuit before using these detectors.

(A) Pen Style— A light in the handle illuminates to indicate continuity. Comes with one 36″ test lead with insulated alligator clip and batteries. UL and C-UL listed. CE approved.

(B) Screwdriver Style— Has an extra-long pointed tip to get into hard-to-reach areas. A light in the handle illuminates to indicate continuity. Comes with one 36″ test lead with insulated alligator clip. Battery required (sold separately).

(C) Audible-Signal Style— A clear, audible signal that can be heard over background noise indicates continuity. Comes with two 48″ test leads with alligator clips. Battery required (sold separately).

	Style	Batteries Required	Detectors	Each	Batteries	Each
A	Pen	Two AAA	**7256K11**	$14.23	**65605T71**	$0.79
B	Screwdriver	One AAA	**6984K71**	13.87	**65605T71**	.79
C	Audible Signal	One 9V	**7411K38**	44.93	**71455K56**	2.75

Pen-Style Multimeter and Detectors

Small enough to carry in your pocket, these pen-style testing devices are a convenient way to troubleshoot circuits. Batteries are included, unless stated otherwise.

(D) Multimeter— This average sensing meter is autoranging, has a built-in noncontact voltage detector, and performs a diode test. An audible signal indicates continuity. Meter also has data hold and a digital LCD. DC accuracy: 0.7%. Max. resistance: 20 MΩ. Includes test leads with alligator clips. CE approved and CAT III, 600V safety rated.

(E-H) Voltage Detectors— To check for a hot circuit, place the pen tip on or near the source you want to test (Style G requires direct contact). Audible alert and indicator light signal the presence of voltage. ***Styles E*** and ***F*** are UL and C-UL listed; CE approved; and CAT IV, 1000V safety rated. ***Style G*** does not require batteries and is UL listed. ***Style H*** are UL listed; CSA certified; CE approved; and CAT IV, 600V safety rated.

(J) AC Current Detector— There is no need for direct contact, so you can detect AC current through shielded wires, conduit, and metal circuit breaker and junction boxes. Detector has a sensitivity adjustment. Audible alert and indicator light signal the presence of current. UL listed; CE approved; and CAT III, 600V safety rated.

(K) Ground Fault Detector— Touch the tip of this detector to an outlet or to the metal case of any tool, machine, or appliance with a three-prong plug. A red light indicates a bad ground. Detector requires two AAA batteries (sold separately).

		Range		Each
D	Multimeter	600 VAC/VDC	**7573K1**	$44.98
E	Voltage Detector	50-1000 VAC	**69595K93**	17.56
F	Voltage Detector	5-1000 VAC	**69595K92**	22.12
G	Voltage Detector	6-50 VDC	**69595K94**	19.50
H	Fluke 1AC-II Voltage Detector	90-1000 VAC	**7053K51**	26.95
H	Fluke 1LAC-II Voltage Detector	20-90 VAC	**7053K52**	26.95
J	AC Current Detector	200 mA-1000 A	**8338T11**	32.97
K	Ground Fault Detector	220 VAC/VDC	**7476K11**	19.46
	AAA Battery		**65605T71**	.79

Insulation Testers

All of these battery-powered meters apply voltage to measure the insulation resistance of items like motors. Furnished with test leads.

Pro-Value LED— Displays resistance readings on a numeric LED readout, indicating Good, Caution, or Bad. Resistance accuracy: 1%. Requires two C batteries (sold separately) and comes with a carrying case. CE approved.

Pro-Value Analog— Measures voltage and has a three-color scale. Resistance accuracy: 5% of indicated value. Comes with batteries and a carrying case. CE approved and CAT III, 1000V safety rated.

Pro-Value Digital— Measures voltage and has an LCD and an analog bar graph. Samples data 2.5 times per second and 10 times per second for bar graph. Resistance accuracy: 3% to 5% depending on range. Comes with batteries and a carrying case. CE approved and CAT III, 600V safety rated.

Megger— Measure voltage and have an LCD. Housing is weatherproof and meets IP54 requirements for splashing water protection. Testers sample data every half second and have a NIST (National Institute of Standards and Technology) certificate. 65765K11 requires eight AA batteries (sold separately) and is CAT III, 600V safety rated. 65765K13 has an alarm and 3% resistance accuracy. It requires five AA batteries (sold separately), comes with a carrying case, and is CAT IV, 600V safety rated.

	Resistance Capacity	Testing Voltage	Voltage Range	Ht. × Wd. × Dp.		Each
Pro-Value						
LED	1000 MΩ	500 VAC	———	6⅜″ × 3⅜″ × 1¾″	**7592K23**	$111.67
Analog	100/200/400 MΩ	250/500/1000 VDC	0-600 VAC	7⅞″ × 3⅝″ × 2″	**7443K19**	196.54
Digital	4000 MΩ	250/500/1000 VDC	0-600 VAC/VDC	7¾″ × 4 7/16″ × 2½″	**7005K43**	272.90
Megger						
MIT310 Digital/Analog	999 MΩ	250/500/1000 VDC	0-600 VAC/VDC	5¾″ × 8″ × 3¼″	**65765K11**	520.13
MIT410 Digital/Analog	100 GΩ	50/100/250/500/1000 VDC	0-600 VAC/VDC	8¾″ × 3⅝″ × 2″	**65765K13**	673.78

C Battery **65605T73** **Each** $1.50 AA Batteries (4/Pkg.) **71455K53** **Per Pkg.** $2.94

Hand-Crank Insulation Testers

You supply the power—just turn the crank on these testers to measure resistance and voltage without using batteries. All have an analog display and include test leads with clips and probes.

Weatherproof— Has an ABS plastic housing, aluminum lid, and a fold-down handle. Resistance accuracy: 2% of full scale. Tester is autoranging and includes a carrying strap. CE approved and CAT II, 600V safety rated.

Megger MJ159— Has an ABS plastic housing and a fold-down handle. Resistance accuracy: 1.25% of full scale. Comes with a carrying case and is CAT II, 300V safety rated.

	Resistance Capacity, MΩ	Testing Voltage, VDC	Voltage Range, VAC	Ht. × Wd. × Dp.		Each
Weatherproof	500/500/5000	250/500/1000	0-600	5 5/16″ × 4⅜″ × 4¾″	**6576K11**	$694.17
Megger MJ159	2000	100/250/500/1000	0-600	5⅛″ × 7″ × 5″	**7229K11**	1,083.75

For information about electrical testing, see page 940.

Hand Tool Insulation Tester

Before you use new or repaired tools, plug them into this tester to check for proper insulation and ground wire continuity. Also known as a hi-pot tester, it applies high voltage (adjustable from 0-2500 VAC) to monitor current through ground and to test dielectric strength for compliance with UL and CSA standards.

Operates on 120 VAC, 60 Hz and has a standard three-prong receptacle. Tester detects leaks from 1-10 mA and has a 6-ft. high-voltage probe for testing individual components. Accuracy: 3%. Size is 7″ Ht. × 12″ Wd. × 10½″ Dp. Tester has a NIST (National Institute of Standards and Technology) certificate and meets UL 120K requirements for hand tool testing.

6991K42 ..... **Each** $1,153.68

Phase-Sequence Indicators

Standard *Deluxe*

Since incorrect motor rotation can damage your motors, generators, and other machinery, it's important to check the phase sequence on your three-phase electrical systems to make sure your equipment is properly connected. These indicators show phase sequence and open phases. Furnished with three test leads with insulated alligator clips and a carrying pouch. CE approved.

Standard— Detector displays the phase sequence on a rotating disc with a color dot. Size is 4¼″ Ht. × 3″ Wd. × 1⅝″ Dp. Does not require batteries.

Deluxe— Because it works on frequencies up to 400 Hz, this detector is good for aviation and military applications. It also indicates rotation of motor before connecting to a live circuit. Size is 5⅛″ Ht. × 2¾″ Wd. × 1¼″ Dp. Comes with a battery. CAT III, 600V safety rated.

	Voltage Range, VAC	Operating Frequency	Lead Lg.		Each
Standard	110-600	50 Hz/60 Hz	59″	**7264K4**	$93.58
Deluxe	40-600	2-400 Hz	49″	**7264K1**	139.96

Receptacle Testers

Receptacle Tester

Receptacle and Tool Ground Continuity Tester

Plug these testers into standard 120 VAC grounded receptacles.

Receptacle Tester— Has a three-prong plug. ETL and C-ETL listed.

GFCI Receptacle Tester— Tests GFCI (ground fault circuit interrupter) as well as standard receptacles. Has a three-prong plug. ETL and C-ETL listed.

Receptacle and Tool Ground Continuity Tester— Has a shock-resistant, safety-yellow rubber housing and a sheathed probe for checking a tool's ground continuity when plugged into a duplex receptacle. Has a two-prong plug.

		Each
Receptacle Tester	**7018K15**	$9.76
GFCI Receptacle Tester	**7018K16**	11.50
Receptacle and Tool Ground Continuity Tester	**7018K14**	74.48

Circuit Breaker Identifiers

120 VAC *90-600 VAC*

Easily locate the circuit breaker controlling a specific load. These identifiers consist of a transmitter and a battery-operated receiver.

120 VAC Identifier— Move the probe over a breaker, and this identifier provides an audible as well as visual indication at eye level. It has a receiver with a magnetic back for attaching to panels and a built-in tester for standard and GFCI receptacles. Battery is included. UL and C-UL listed. *Optional adapter kit for 120 VAC identifier* allows you to identify circuits for light bulb sockets and light switches.

90-600 VAC Identifier— Has a transmitter that plugs into a receptacle (a red LED lights to indicate a live circuit). You can then scan the breakers with the receiver (it beeps and flashes a red LED to show the correct breaker). Requires a 9-volt battery (sold separately).

		Each
120 VAC Identifier	**70195K41**	$58.68
90-600 VAC Identifier	**70195K53**	96.13
Optional Adapter Kit for 120 VAC Identifier	**70195K42**	15.42
9-Volt Battery	**71455K56**	2.75

Circuit Tracers

65815K66

No need to power down—these portable systems work on energized circuits, allowing you to trace wires in walls and locate short circuits, open circuits, and circuit breakers. They also trace de-energized circuits and identify wires in a bundle. CE approved.

0-300 VAC/DC System— This system can trace coaxial cable. Includes a transmitter, receiver, pigtail connectors, batteries, and a soft carrying case. Receiver range is 1-3 ft. from cable being traced.

9-600 VAC/DC System— Detects live lines buried to depths of up to 13 feet. This system also traces wire in conduit and more than a mile of open wire. Includes a load-signal generator, receiver, pigtail connectors, battery, and plastic carrying case. Also has a clamp-on current transducer that allows identification of equipment on a circuit.

Voltage Range for Energized Circuits	Traces Ground Faults	Traces Buried Lines		Each
0-300 VAC/VDC	No	No	**65815K63**	$406.20
9-600 VAC/VDC	Yes	Yes	**65815K66**	972.14

Line Splitter

Use your clamp-on test leads to measure AC current on two- or three-conductor power cords up to 15 A without separating the conductors. Just plug your device into the splitter and plug the splitter into an outlet. UL and C-UL listed and CAT II, 600V safety rated.

7575K83 ..... **Each** $15.47

Current-Sensing Clamp-On Test Leads

Plug these test leads into your multimeter, recorder, or data logger and you can read current without interrupting the circuit. All have a right-angle sheathed banana plug.

(A&B) Test Leads— Multiply the reading shown on your meter by 1000 to determine actual current. Output signal is 1 mA/A. These leads do not require batteries. *Style B* is UL listed; CSA certified; CE approved; and CAT IV, 600V safety rated.

(C) Flexible AC Test Leads— Have a flexible sensor to fit into tight spots. Output signal is 10 mV/A for the 5-300 A range; 1 mV/A for the 50-3000 A range. Batteries are included. CE approved and CAT III, 1000V safety rated.

(D) AC/DC Test Leads— Come with batteries and are CE approved.
65775K79 output signal is 1 mV/A for the 0-200 A and 0-1000 A ranges.
65775K81 output signal is 10 mV/A for the 0.2-40 A AC and 0.4-60 A DC ranges; 1 mV/A for the 0.5-400 A AC and 0.5-600 A DC ranges. CAT III, 600V safety rated.

		Current Range, Amps	Operating Frequency	Accuracy	Jaw Opening	Lead Lg.		Each
A	AC	2-150 AC	45 Hz-1000 Hz	4.5%	0.5″	60″	**7575K67**	$154.58
B	Fluke i400 AC	1-400 AC	5 Hz-20 kHz	2%	1.3″	59″	**7575K66**	132.95
C	Flexible AC	5-3000 AC	40 Hz-5 kHz	1%	7.6″	78″	**7575K81**	271.25
D	AC/DC	0-1000 AC/0-1000 DC	0 Hz-10 kHz	1%	1.2″	59″	**65775K79**	169.52
D	AC/DC	0.2-400 AC/0.4-600 DC	0 Hz-10 kHz	2.5%	1.2″	60″	**65775K81**	359.26

Alligator Clips

The clips and insulator sleeves that are sold per package are packaged in quantities of 10. Insulator sleeves are vinyl.

Panel-Mount Connection Posts

Single Fluted Post (Installed) — *Dual Hex-Head Post*

Also known as binding posts, these posts mount through panels to provide a connection point for wires with various terminations (banana plugs, spade terminals, and ring terminals) as well as for bare stranded wires. All posts are insulated with polycarbonate to prevent contact with panels, unless noted.

Hex-head posts have to be tightened with a wrench. ***Fluted posts*** can be tightened with your fingers.

To Order: Where applicable, please specify color: black or red.

♦ Insulated with rubber. ▲ Two holes on ¾″ centers.

Panel-Mount Banana Jacks/Receptacles

Designed for use as a connection point for wires with banana plug terminations, these jacks/receptacles can be mounted in 0.063″ to 0.375″ thick panels. They're tin-plated brass and are insulated with polycarbonate to prevent contact with panels. Voltage rating is 30 VAC/60 VDC hand held and 2,500 VDC hands free for 7124K41; 33 VAC/70 VDC hand held and 2,500 VAC hands free for 7124K42. Current rating is 15 A.

To Order: Please specify color: black or red.

	Panel Cutout, Dia.	Overall Size	Pkg. Qty.		Pkg.
Single	0.35″	0.50″ Dia. × 1.22″ Lg.	10	7124K41	$17.75
Double	0.375″▲	1.22″ Lg. × 1.38″ Wd. × 0.75″ Ht.	1	7124K42	4.03

▲ Two holes on ¾″ centers.

Test Lead Holders

Organize and store your test leads and patch cords with these wall-mount holders. They're steel with a baked-enamel finish. Overall size is 11″ Lg. × 3½″ Wd.

No. of Slots	Max. Cable Thickness	Color		
14	0.21″	Orange	6938K67	$11.56

Spring Test Probes

Eliminate the need for hand-held test probes. These spring-loaded probes permanently attach to testing fixtures for repetitive testing of electrical circuits and PC boards. A complete spring test probe consists of a probe and socket (each sold separately). All are sold in package quantities of 5.

Probes— Can be replaced without removing sockets. Working stroke is 0.17″; maximum stroke is 0.25″. *90° cup probes* are for testing leads, terminals, and pins. *30° spear probes* are for testing flat surfaces. *Waffle probes* have a universal tip for testing flat surfaces as well as leads, terminals, and pins.

Sockets— Crimp or solder sockets to the wires leading into the testing system, then mount in your testing fixture. Finally, fit probes into the sockets. A 22-26 AWG crimper (not included) is recommended for the crimp tip style.

Analog Panel Meters

Wide-View AC Ammeter

Standard DC Ammeter

These square meters require a round cutout (see table below for dimensions). They have a phenolic case, black pointer, four mounting studs with 4-40 threads, and screw terminals for electrical connection. All have an accuracy of ±2%. UL recognized.

AC voltmeters and ***ammeters*** have a frequency range of 25 to 125 Hz. Calibrated at 60 Hz.

AC voltmeters, DC voltmeters, and ***DC ammeters*** can be mounted on steel panels without being affected by electromagnetic interference (EMI).

Standard case have a glass window.

Wide-view case gives you a better view of readings. Window is clear acrylic.

★ Includes a 100:5 amp current transformer.
■ Includes a 100 amp shunt.

Digital Panel Meters

Standard LED Meter

All feature automatic zero, a connection strip with screw terminals, and display hold and test. Operating temperature range is 32° to 131°F, unless noted. DC meters also display polarity.

Standard LED meters fit a 1/8 DIN (3.62″×1.77″) panel cutout. They have a 3½ digit LED display that's 0.56″ high and operate on 120 VAC, 50/60 Hz.

Miniature LCD meters fit a 3/64 DIN (2.68″×0.88″) panel cutout. They have a 3½ digit LCD display that's 0.5″ high and operate on 85-250 VAC, 40-440 Hz. CE certified.

Modular Digital Panel Meters

Display Module

Power Supply Module

Input Module

No need to buy a complete unit if your power or input requirements change—modules are interchangeable so you can build or modify your own meter in a few minutes. A basic meter requires a display, a power supply, and an input module (units can only use one input module at a time). When assembled, a complete meter is 1/8 DIN and 1.9″ Ht.×3.8″ Wd.×4.1″ Dp.

Display modules have a NEMA 4, IP67 water-tight housing when panel mounted. They feature min./max. recording, password protection, and data hold. *Resistance/temperature input module* accepts Types J, K, S, T, and E thermocouples.

Build a controller by adding an ***optional output module***. Units assembled as controllers have a programmable setpoint, hysteresis, time delay, and relay status.

	Max. Input

Test Lead Cords

Coiled ***Straight***

All of these cords have single-conductor, stranded tinned-copper wire.

Coiled—Cords stretch to 5-ft. long; recoil to 12″ long. They have a neoprene jacket. Rated 4 A at 1,000 VAC.

Straight—Cords come in 50-ft. long spools. They have a PVC jacket. Rated 5,000 VAC. UL recognized.

Style	AWG	Red Color		Black Color	
Coiled	20	**7058K22**	$15.80	**7058K24**	$15.86
Straight	18	**7058K34**	21.36	**7058K32**	21.36

Remote Digital Displays for Transducers

- Accuracy Range: ±0.03% of span
- 6-digit, dual line red LED for displays from –99,999 to +999,999
- Electrical Connections: Removable screw terminal block
- Operating Temperature Range: –40° to 149° F

These digital displays have a built-in, 24-VDC supply that powers your transducer. They are switch-selectable for input signals of 0-20 mA, 4-20 mA, 1-5 VDC, 0-5 VDC, and 0-10 VDC and have nonvolatile memory (no battery needed). Displays have a 1/8 DIN, high-impact plastic enclosure and NEMA 4X front panel with gasket as well as a lockout feature that prevents tampering. A 1.772″×3.622″ panel cutout is required.

Digital display ***with alarm board*** comes furnished with screw terminal connections and two SPDT (single pole, double throw) relays that are rated 3 amps at 150/250 VAC.

Power Supply	*Standard*		*With Alarm Board*	
85-265 VAC	38445K21	$427.14	38445K22	$537.50

DIN-Rail Mount Voltage Transducers

Take an AC input voltage and transform it into a DC output signal with these transducers. They mount easily to DIN rail and have true RMS sensing capability for more accurate readings. Ideal for use with panel meters, data acquisition devices, and automation systems. They run on 24 VDC and have a plastic housing. Size is 2.99″ Ht.×1.42″ Wd.×3.27″ Dp., unless noted. UL and C-UL recognized.

To Order: Please specify AC voltage input range: 0-150, 0-250, or 0-500 volts.

No. of Wires/ Phase	*0-5 VDC Output*		*4-20 mA Output*	
Single/Single	6853T21★	$197.87	6853T22★	$218.68
Three/Three	6853T23	345.02	6853T24	390.52
Four/Three	6853T25	499.90	6853T26	557.16

★ Height is 2.20″.

Current Transformers, Transducers, and Relays

Current Transformers

Designed for current measurements, these transformers step down high current to give a 0-5 amp output that can be used as input for panel meters and data acquisition devices. UL recognized.

Current Ratio		
1 1/8″ Max. Wire Diameter		
50:5	65795K79	$20.39
80:5	65795K81	20.39
100:5	65795K82	20.39
150:5	65795K84	20.39
200:5	65795K85	20.39
300:5	65795K87	20.39

Current Ratio		
2 1/2″ Max. Wire Diameter		
500:5	65795K91	$49.74
750:5	65795K92	49.83
1,000:5	65795K93	75.02
1,200:5	65795K94	75.02
1,500:5	65795K95	75.02

Current Transducers

Step down high current just like transformers, but also give you a conditioned output signal that can be used as input for panel meters, data acquisition devices, and automation systems. Transducers have two 0.19″ dia. mounting holes and an ABS plastic housing that meets UL94-V0 for flammability. UL listed, C-UL listed, and CE approved.

Loop-powered models require a 24 VDC power supply.

Use ***feed-through*** models for new installations. Feed wire through the opening. Maximum wire opening is 0.74″ dia.

Wraparound models eliminate the need to disconnect the current-carrying conductor, so they're ideal for retrofit applications. Housing is hinged to allow you to go around your wire. Maximum wire opening is 0.85″.

Feed Through

Wraparound

Two	0.26″	6733T13	345.02	6733T14	390.52
Three	0.26″	6733T15	499.90	6733T16	557.16

Single Wire

Current Relays

Sense electrical current and provide relay output when current exceeds a set point. Great for monitoring AC current overloads on motors and open heater elements. Relays have variable trip range and delay-on timer that's adjustable from 0.5 to 6 seconds. Trip range listed is for one wire pass through wire opening. To determine actual range, divide the listed trip range by the number of wire passes. Output contacts are SPDT and rated 10 amp resistive @ 240 VAC (for a definition of SPDT, see page 855). Relays require 120 VAC power and accept a maximum wire diameter of 1/2″. UL recognized.

Trip Range		
0.1-1 A	65795K69	$122.12
1-10 A	65795K71	75.81

6-60 A	65795K73	75.81
10-100 A	65795K74	75.81

Electric Current Indicating Rings

Monitor AC current flow by running current-carrying wire through these rings.

Ring with red LED will light when current is present.

Rings with wire leads attach to remote LED (sold separately below) for monitoring current from distances up to 200 ft.

Ring with LED and Optional Mounting Bracket

Current Loop Checker and Calibrator

By providing a precise output current, these instruments allow you to check or calibrate your process indicators and meters. They include a connector cable with spade lugs and 9-volt battery.

Fixed-Output Checker— Select from three current outputs of 4, 12, and 20 mA to check circuits with a resistance up to 240 ohms. This pocket-size checker has LED indicators and push buttons to select between outputs. Accurate to 0.01 mA. Includes low-battery indicator and carrying case. Size is 2 3/8″×3 1/2″×1″.

7057K49 ..... $106.76

Fixed-Output Checker

Variable-Output Calibrator— Select any output between 0-24 mA for calibrating circuits with a resistance up to 1,000 ohms. Output can also be displayed from –25 to +125%. In addition, calibrator provides 24 VDC power to measure loop currents from 0-24 mA. Has a four-digit LCD display. Accuracy is ±0.075%. Includes an AC adapter and carrying case. Size is 3.8″×4.7″×1.8″.

7057K69 ..... $264.39

Variable-Output Calibrator

Contact Replacement Kits

Contact Cleaning Spatula

With a minimal amount of pressure, the diamond particle blade on this spatula cleans contacts while removing very little metal. The diamond blade has a coarse grit, 7/8″ Lg.×1/4″ Wd. face. Handle is nylon with a 5 5/8″ long shaft.

6304T11 ..... $42.46

Commutator Chalk Stones

Also known as brush seating stones, these soft, loosely bound, white grain stones scour without removing or scratching copper. Ideal for seating carbon brushes and cleaning commutators, slip rings, and other electrical contacts.

Stone Size, Wd.×Lg.×Thick.	Grade		
1/2″×4 3/4″× 1/4″	Medium	**7502K11**	$4.06

2″ ×4 3/4″×1″	Soft	**7502K18**	17.98

Commutator Resurfacers

Also known as commutator stones, these resurfacers clear away streaks, grooves, and irregular workings from the surfaces of commutators as well as copper or brass slip rings on medium to large motors.

To Order: Please specify grade: Extra-coarse (36 grit), coarse (46 grit), medium (90 grit), finish (120 grit), or polish (220 grit).

Fixed Handle— Also known as a tramway handle, it's permanently mounted at a 45° angle for a positive grip in awkward positions.

Adjustable Handle— Insert into the knob-grip at one of two 45° angles or in the vertical position.

Stone Size, Thick.×Wd.×Lg.	Fixed Handle Lg.			Adjustable Handle Lg.

Commutator Cleaning Kit

Everything you need to clean small commutators and seat carbon brushes is found in this kit. Kit contains a flexible stone handle, two coarse stones, two medium stones, two finish stones, two extra finish stones, and four seating stones. Handle is 9″ long and easily secures to stones. All stones are 1″ Ht.×3/4″ Wd.×5/16″ Thick.

5951T11 ..... $37.95

Electrical Insulating Varnish

Penetrates worn insulation, then dries to form an abrasion- and wear-resistant insulating layer. This aerosol spray varnish won't deplete the ozone layer, but is flammable and may not be suitable for all plastics; test before use. All are Class F insulators (withstand temperatures up to 310° F). Full case quantity is 12.

Clear leaves a transparent film, so components can be inspected. Great for coating circuit boards. *Red* works well for identification, such as a coating for wiring. *Green* is designed for harsh environments and is oil resistant.

	Net Wt.	Dielectric Strength, volts		Each Partial Case	Each Full Case
Clear	15.25 oz.	2,300	**7437K21**	$5.93	$4.88
Red	15.25 oz.	2,600	**7437K19**	6.49	5.32
Green	15.25 oz.	2,890	**7437K22**	7.98	6.61

Ultrasonic Sensors

With Cable

High-frequency sound waves can detect objects of all sizes, shapes, colors, and materials—even in dusty and dirty environments. These threaded sensors also measure the distance to a target. You can specify a particular range of detection anywhere within the sensing distance—just set the turn-on and turn-off point of detection. All have short-circuit and reverse-polarity protection. Operate on 20-30 VDC. Size is 30 mm Dia.×100 mm Lg. Operating temperature range is 32° to 140° F.

Digital-output sensors have two solid state relays, one that switches from "off" to "on" (normally open) and one that switches from "on" to "off" (normally closed). They are rated at 50 mA @ 130 VAC, 100 mA @ 130 VDC. Sensors *with cable* have six ft. of five-wire cable; sensors *with male plug* are five pin with dual keyway.

4″-40″ sensing digital models have a response time of 30 milliseconds. *8″-80″ sensing* models have a response time of 50 milliseconds.

Analog-output sensors have one 0-10 VDC voltage output and one 4-20 mA current output. They have zero span controls for precise adjustments. An LED strength indicator shows the accuracy of the target alignment. Sensors *with cable* have six ft. of four-wire cable; sensors *with male plug* are four pin with single keyway.

4″-40″ sensing analog models have 16 millisecond response time. *8″-80″ sensing* models have 35 millisecond response time.

Sensors with ***plastic*** housing are suitable for most applications. Sensors with Type 303 ***stainless steel*** housing are ideal where corrosive liquids are present.

AC Motor-Start and Motor-Run Capacitors

Capacitors store electrical energy to maximize the life and performance of your motor.

AC Motor Start—Work with small, single-phase AC motors to increase starting torque and allow for rapid on and off motor cycling. For use on fans, burners, pumps, compressors, and refrigerators that have a high starting torque. Operating frequency is 50/60 Hz. Capacitance tolerance is ±10% and temperature range is –40° to +149° F. These capacitors are housed in moisture- and oil-resistant plastic and have 1/4″ male quick-disconnect terminals. Meet Electrical Industries Association (EIA) Type II specifications. UL recognized; CSA certified.

AC Motor Run—Designed for continuous duty use at 60 Hz on AC motors. These capacitors provide an even magnetic field, which reduces energy consumption and improves motor performance for motor-run applications and AC power supplies. Capacitance tolerance is ±6% and temperature range is –40° to +158° F. They have 1/4″ male quick-disconnect terminals. UL and C-UL recognized.

160-Brush Assortment

Quick-n-Secure DIN-Rail Mount Fuse Blocks

Blocks mount on 35 mm DIN rail and have spring wire clamps for quick, secure connections, even in high-vibration applications. Choose from standard blocks and blocks with a neon/LED indicator light that identifies a blown fuse. Made of gray nylon. Temperature range is –31° to +221° F. UL recognized. CSA certified. For screw-clamp block-style terminal fuse blocks, see page 754.

Blocks for 1/4″ Dia. × 1 1/4″ Lg. and ***5 mm Dia. × 20 mm Lg. fuses*** accept 28-12 AWG wire. ***Blocks for blade-style fuses*** accept 24-10 AWG wire.

End sections provide insulation and protect the open side of the block (one is required per assembly).

End Section for Blade-Style Fuse Blocks	9553T9	1.06

9553T1

Dusters

Clear dust, dirt, and other dry contaminants from printed circuit boards and keyboards, as well as electronic and laboratory instruments, contacts, and connectors. These dusters are nonflammable, safe for plastics, and won't deplete the ozone. All contain compressed gas.

Upright duster contains a moisture-free inert gas (HFC-134a) and must be held upright to spray.

Any-angle duster has a moisture-free halogenated hydrocarbon gas and sprays a burst of dry air at any angle, even upside down.

High-pressure precision duster has a reusable valve with a tapered-tip nozzle for precision positioning that screws onto the CO_2 cylinder. The valve also controls the air flow, which can vary from a gentle puff to a high-pressure burst. Cylinder is steel, disposable, and recyclable.

Net Wt.	Air Pressure	Approx. No. of 1 sec. Bursts	Dusters	Each ♠	Replacement CO_2 Cylinders	Each ♠
Upright						
10 oz.	86 psi	—	7437K34	$10.97	—	—
Any Angle						
8 oz.	80 psi	—	7437K35	13.65	—	—
High-Pressure Precision						
2.6 oz.	325 psi	725	8431K13	63.53	8431K22	$15.44

♠ Prices are 15% less if purchased in full case quantities. Full case quantity is 12 for dusters and 24 for replacement CO_2 cylinders.

Freeze Spray

Chill individual electronic components to –60° F to isolate problems on printed circuit boards. Spray is nonflammable and won't deplete the ozone layer. Full case quantity is 12.

Standard spray is safe for plastics.

Antistatic spray is ideal for static-sensitive components and safe for plastics.

	Net Wt.	Dielectric Strength, volts		Each Partial Case	Each Full Case
Standard	10 oz.	26,000	7437K43	$12.37	$10.61
Antistatic	10 oz.	26,000	7437K61	15.73	14.11

Antistatic Spray

Neutralize static electricity in high static areas. Sprays are safe for plastics and leave a clear coating that does not corrode or stain. They won't deplete the ozone layer.

Flammable aerosol spray dries instantly. Temperature range is 0° to 181° F.

Nonflammable nonaerosol spray dries quickly.

	Net Wt.		1-11	12-Up
Flammable Aerosol	11.5 oz.	6038T11	$12.97	$11.04
Nonflammable Nonaerosol	16 oz.	6038T12	20.98	17.92

Electrical Cleaners/Degreasers

Excellent for general purpose electronics and electrical cleaning, these cleaners/degreasers remove dirt, dust, oil, and grease from printed circuit boards, transformers, and office equipment. All are quick drying.

NSF registered are K2 rated for use in food processing environments. *Extra strength* has a more powerful cleaning formula.

Aerosol spray does not contain harmful HCFCs that deplete the ozone layer. These products are compliant under all state VOC rules in effect on October 1, 2009.

	Net Wt.	Safe on Plastics	Dielectric Strength, volts		Each ♦

Electrical Contact Cleaners

Purge oil and grease from electrical contacts in relays, contactors, circuit breakers, fuse blocks, and control panels. These cleaners are quick drying.

NSF registered are K2 rated for use in food processing environments. *Extra strength* has a more powerful cleaning formula.

Aerosol spray can also purge carbon soils. Does not contain harmful HCFCs that deplete the ozone layer. 7437K15 (cleaner with lubricant) leaves a microscopic film that prevents corrosion.

Nonaerosol spray is not pressurized and does not have any special disposal requirements.

	Net Wt.	Safe on Plastics	Dielectric Strength, volts		Each ♦

Electrical Contact Cleaners and Sealants

Designed to be used together, deoxidizers/improvers and sealants remove oxidation and corrosion from electrical connections and protect against future corrosion. Use on batteries, switches, relays, probes, plugs, sockets, and all contacts and connectors to improve the electrical conductivity of your connection. All are ozone safe and safe for plastics.

Deoxidizers/improvers provide long-lasting protection for all metal surfaces.

Sealants seal and protect electrical contacts and connections on metal surfaces (use after a deoxidizer/improver). Ideal for high humidity, corrosive, and salty environments.

Sealants for gold surfaces improve conductivity, clean electrical connections, and provide lasting protection. Specially formulated for gold surfaces, they penetrate and molecularly bond to base metals.

Net Wt.	Dispenser	Flammable		
Deoxidizers/Improvers				
5 oz.	Aerosol	Yes	8381T11	$14.88

Electrical Contact Cleaner and Sealant Kit — Includes a total of six containers, one 0.5 oz. mini spray can and one 0.07 oz. squeeze tube of each style: deoxidizer/improver, sealant, and sealant for gold surfaces. Furnished with cloths, brushes, and swabs for application.

8381T21 ..... $34.56

Electrical Connection Corrosion Inhibitors

Prevent corrosion and seizing while reducing the electrical resistance of your connections. These copper compounds seal out moisture, corrosive fluids, and gases. They simultaneously protect, lubricate, and enhance the conductivity of your cable strands, threaded connections, switches, lugs, and other connectors. They're easy to apply with the included brush, and will not run, drip, or harden. Temperature range is –50° to +250° F. UL listed.

1½-oz. Container	2953K11	$6.68
8-oz. Container	2953K12	34.46
16-oz. Container	2953K13	49.93

Motor Cleaners

Clean dirt, grease, and grime from electric motors and generators. Cleaners are nonconductive, nonflammable, and won't deplete the ozone layer.

NSF registered are K2 rated for use in food processing environments. Full case quantity is 12.

About Air Compressors

Air-Flow and Pressure Requirements— It's important to consider your compressor's air flow in cubic feet per minute (cfm). To determine the air-flow requirements, total the cfm requirements of all the air-powered tools your compressor will be operating simultaneously. Your compressor should also exceed the pressure (psi) requirement of the highest-pressure-rated tool to which it will be supplying power. Add 20%-30% to allow for system variables and future expansion.

Premium Continuous-Duty Air Compressors

Stationary, Electric, Horizontal

Stationary, Electric, Vertical

Mobile, Electric, Twin Tank

Built to withstand your most demanding environments, our top-of-the-line compressors have a cast iron crank case that's more durable than the aluminum crank case found on other models. All are rated for continuous operation and have a larger flywheel for exceptional heat dissipation and wear resistance. They work with 30-wt. nondetergent oil and are belt driven with splash lubrication.

Compressors have a manual tank drain. Outlet port is NPT female. UL listed, unless noted.

Stationary Air Compressors

All have a two-stage reciprocating piston design that's essential for systems requiring pressures of 100 psi and greater. They also have a single tank and high-efficiency intercoolers for heat dissipation. A start-stop switch turns motor on at 145 psi (165 psi for gas-engine model) and off at 175 psi. All must be hardwired. Compressors have an ASME-code tank.

Models with electric motor have a magnetic starter that's wired and mounted to the compressor for overload protection. *Single-phase electric motors* operate on 230 VAC, 60 Hz. *Three-phase electric motors* operate on 60 Hz with your choice of voltage. **To Order:** Please specify voltage: 200, 230, or 460 VAC. ***Model with gas engine*** has an electric-start Kohler engine.

Mobile Air Compressors

With one semi-pneumatic rubber wheel, you can move these compressors where they're needed. All have a one-stage reciprocating piston design. A start-stop switch turns motor on at 90 psi and off at 135 psi.

Models with electric motor have a single-phase motor and a 6-ft. cord with three-prong plug. ***Model with gas engine*** has a pull-start Honda engine.

Air Flow, cfm @ 135 psi	Max. psi	Motor: hp	Motor: Voltage @ 60 Hz	Motor: Full Load Amps	Tank: Cap., gal.	Tank: Style	Outlet Size, NPT	Overall Size, Lg.×Wd.×Ht.	Wt., lbs.	dB Rating	Each

♦ Not UL listed.

Continuous-Duty Oilless Air Compressors

A

B

C

D

Dispensing 100% oil-free air, these compressors allow clean continuous operation with less maintenance. They're great for oilless air-powered tools and have a handle, which makes it easy to take them where they're needed. Outlet port is NPT female.

Compact Tankless— No tank means this compressor is more compact. It has a single-phase, 60 Hz motor with thermal overload protection. Compressor also has a cast iron body, 50-micron air inlet filter, and a safety relief valve. Must be hardwired.

Pancake and ***Hot Dog Tanks—*** With a tank to store compressed air, these compressors don't have to run all the time and generally produce higher flow rates than tankless models. All have a single-phase, 60 Hz motor; start-stop switch, which turns motor on at 120 psi (unless noted) and off at the maximum psi (see listing below); a steel tank; a manual tank drain; and a 6-ft. cord with three-prong plug.

■ Motor turns on at 160 psi.

For information about air compressors, see page 956.

Compressed Air Regulating Manifold

Simultaneously operate up to four tools at two different psi settings with this one manifold and your air compressor. Great for running various types of tools as well as the same tools in different areas of a single job site. Made of zinc and impact-resistant plastic.

Manifold has a 3/8″ inlet fitting with four outlets that accept 1/4″ industrial and ARO quick-disconnect couplings, see page 298. Two outlets operate at the input psi, and the other two outlets are adjustable from 0-150 psi. Furnished with a relieving-style regulator and a pressure gauge, which has an accuracy of ±3%.

Pipe Size Inlet	Pipe Size Outlet	Max. scfm @ 100 psi	Regulating Range, psi	Max. Pressure	Max. Temp.	Overall Size, Lg. × Wd. × Ht.		Each
3/8″	1/4″	20	0-150	200 psi	120° F	12.5″ × 7″ × 4.5″	1527T67	$68.74

Ultra-Miniature Low-Flow Air Compressors/Vacuum Generators

You'll get an air compressor and vacuum generator combined in one tiny device. All dispense 100% oil-free air for clean continuous operation with less maintenance. They're powered by a motor that operates on 12 VDC (except for model 4404K12, which operates on 3.5-7 VDC), have a very low flow rate, and need no lubrication. All must be hardwired.

Air Flow, cfm @ Max. psi	Max. psi	Max. Vacuum	Full Load Amps	For Tube ID	Overall Size, Lg. × Wd. × Ht.	dB Rating		Each

High-Flow Low-Pressure Air Blowers

Single-Stage Blower

Also known as regenerative blowers, vortex blowers, side-channel blowers, and ring compressors, these blowers deliver high air flow rates at low pressure. They can operate as either a blower or vacuum pump. All have a high-speed rotating impeller that regenerates or compresses air inflow with each revolution. Great for drying, aeration, air-powered conveying, and spraying.

Blowers dispense 100% oil-free air for clean operation with less maintenance. An internal (unless noted) muffler is included for reduced noise. Blowers have an aluminum housing (except for model 9960K66, which is cast iron). Rated for continuous operation, they are powered by a motor that operates on 60 Hz. They must be hardwired.

Note: You must use clean, filtered air (free of debris) with these blowers. We strongly recommend an air intake filter (see pages 371-372) and a relief valve (see below and pages 486-489) to protect against damage from overheating.

Single-Stage Blowers—*Standard models* have NPT female inlet and outlet ports. Motors are UL recognized, CSA certified, and CE approved.

Low-noise models have tighter internal tolerances and internal impellers designed for higher flow rates and quieter operation. Inlet and outlet ports are NPT female. Motors are UL recognized, CSA certified, and CE approved.

Two-Stage Blowers—These blowers have a high-speed rotating impeller that compresses the air twice (once on each side of the impeller) for high air flow at higher pressures than single-stage blowers. Inlet and outlet ports are NPT female. Motors are CE approved and C-UL recognized.

Air Flow Boosters

Operation Diagram

Standard Mount

Flange Mount

Anodized Aluminum Booster, Standard Mount

Zinc Alloy Ultra-Flow Booster, Flange Mount

Precision Adjustment Aluminum Booster with Adjustable Output, Standard Mount

Convert your low-flow, high-pressure shop air into high-flow, lower-pressure air. When your shop air enters the booster inlet connection, it induces a large volume of air that exits the booster through the outlet connection at a high velocity (see operation diagram at left). All boosters work with clean filtered air and are maintenance free (have no moving parts or electrical connections). Great for drying, conveying, ventilating, aerating, removing smoke and fumes, parts cleaning, and removing chips. Boost ratio is constant. Ports are NPT male, unless noted.

Boosters— All have smooth (not barbed) inlet and outlet connections. Made of anodized aluminum, they have good chemical compatibility.

Ultra-Flow Boosters— These are the highest-flow boosters we offer. They are lightweight, corrosion resistant, and spark resistant. All have smooth (not barbed) inlet and outlet connections.

Flange-mount models have a built-in flange on the outlet air connection for easy mounting.

Boosters with Adjustable Output— You can adjust the air flow output on these boosters.

Precision Adjustment Aluminum—Control the air output with an adjustment ring, which has numbered settings. Inlet connection is smooth (not barbed). Outlet connection is barbed. All boosters are lightweight with good corrosion resistance.

Type 303 Stainless Steel—Adjust the air flow output by rotating the outside barrel of these boosters. Inlet and outlet connections are smooth (not barbed). All boosters have excellent corrosion resistance.

Aluminum—To change the air flow output, just unscrew the threaded locknut and rotate the output tube. Inlet connection is barbed. Outlet connection is smooth (not barbed). All boosters are lightweight with good corrosion resistance.

Air Pressure Boosters

Compact

High Flow

Standard

Boost your shop air pressure by trading air flow for higher pressures (as your air flow rate decreases, your pressure increases). These boosters are driven by your compressed air source, so they do not require electricity. When connected, pressure at the outlet will be increased by the boost ratio of the booster.

All of these boosters have aluminum and stainless steel construction. They offer good corrosion resistance and include an exhaust muffler. Ports are NPT female.

Compact— These boosters allow you to regulate output pressure by turning a knob. To operate, connect your compressed air to the inlet port. Furnished with two gauges.

Standard— Boosters dispense 100% oil-free air for clean operation with less maintenance. To operate, connect your compressed air to the inlet port.

High Flow— Boosters are rated for 50% duty cycle. They dispense 100% oil-free air for clean operation with less maintenance. To operate, connect your compressed air to the boosters' three inlets: the air inlet port (air that will be boosted), the drive air port (to operate booster), and the pilot air port (to control the internal valve).

These rugged tanks meet the American Society of Mechanical Engineers' (ASME) pressure vessel code. They have mounting feet; pressure-rated plugs; and a welded plate that lists ASME approval and maximum pressure, which is 200 psi. Tanks are rated for 29.9″ Hg vacuum, but are not ASME rated for vacuum. They have a temperature range of –20° to +650° F, unless noted. All openings have NPT female threads.

Models with top plate have a plate for mounting other air-system components your setup may require.

Steel— Tanks are made of precision-fabricated steel with steel plugs. Gray powder-coated finish.

Epoxy-Lined Steel— An epoxy lining prevents the internal surface of these tanks from rusting. Use them in areas where air-line contamination is a concern. Plugs are steel. Black powder-coated finish.

Stainless Steel— Temperature range is –20° to +200° F. *Type 304 stainless steel tanks* offer good corrosion resistance. Plugs are Type 304 stainless steel. Gray primer-coated finish. *Type 316 stainless steel tanks* offer excellent corrosion resistance. Plugs are Type 316 stainless steel.

ⓘ For additional information about tanks with top plate, such as top plate mounting dimensions and NEMA motor compatibility, go to mcmaster.com and search for **4377KAC**.

High-Pressure ASME-Code Horizontal Pressure Tanks

Able to store air at high pressures, these tanks meet the American Society of Mechanical Engineers' (ASME) pressure vessel code. They have mounting feet; hand-tightened pressure-rated plugs; and a welded plate that lists ASME approval and maximum pressure, which is 600 psi. Tanks are rated for 29.9″ Hg vacuum, but are not ASME rated for vacuum. They have a temperature range of –20° to +450° F. All openings have NPT female threads.

All tanks are made of steel with steel plugs. Gray primer finish.

ASME-Code Vertical Pressure Tanks

Style 1 without Top Plate

Style 2 with Top Plate

Style 3 without Top Plate

Save floor space with these durable vertical tanks. All meet the American Society of Mechanical Engineers' (ASME) pressure vessel code. They have pressure-rated plugs and a welded plate (unless noted) that lists ASME approval and maximum pressure. Tanks are rated for 29.9″ Hg vacuum (unless noted), but are not ASME rated for vacuum. All openings have NPT female threads. Gray primer finish (unless noted).

Epoxy-Lined Steel— An epoxy lining prevents the internal surface of the tanks from rusting. For use in areas where air-line contamination is a concern.

Standard Tanks

Maximum pressure is 200 psi. Temp. range is –20° to +650° F. All tanks have a gray powder-coated finish except 9554K65, K66, and K67 have a painted black finish.

Styles 1 and 2— Mounting hole size is 9/16″, unless noted. *The 1- to 20-gal. tanks* have a base ring with angle clips. *The 30- to 120-gal. tanks* have mounting feet (unless noted). *Models with top plate* have a plate for mounting other air-system components your setup may require. ***Style 3—*** Tanks have a base ring. Mounting slot size is 9/16″×7/8″.

ⓘ For additional information about tanks with top plate, such as top plate mounting dimensions and NEMA motor compatibility, go to mcmaster.com and search for **4376KAC**.

Portable Stainless Steel ASME-Code Pressure Dispensing Tanks

Use air and other gases to pressurize these tanks for storing and dispensing hazardous, corrosive, and high-purity substances. The top has one ¼″ NPT female inlet connection; one ¼″ NPT outlet connection with an internal dip tube for dispensing liquid under pressure (outlet connection is ⅜″ without the dip tube); and two ¼″ NPT female connections for gauges, safety valves, etc. Maximum operating temperature is 300° F. Meet American Society of Mechanical Engineers' (ASME) requirements for unfired pressure vessels. *9″ dia. tanks* also have an EPDM removable gasket on the bottom.

The opening on all tanks has an EPDM pressure seal that can't be removed while unit is pressurized. ***Standard-mouth tanks*** have a 3″ × 4″ opening. ***Wide-mouth tanks*** have a 5″ × 6″ opening for easy filling, cleaning, and inspection.

Type 304 Stainless Steel— Offers good corrosion resistance.

Type 316L Stainless Steel— Offers superior corrosion resistance. Great for semiconductor and washdown areas. *Mirror-finish models* have an extremely smooth finish. With fewer imperfections on the surface, these tanks offer even greater corrosion resistance and are easier to clean.

Also Available: Vacuum closure caps for putting tank under vacuum, fluoroelastomer seals, replacement EPDM pressure seals, and replacement covers. For vacuum caps, fluoroelastomer seals, and replacement covers, ask for 6778K888 for standard-mouth tanks or 41665K888 for wide-mouth tanks, and please specify vacuum caps, fluoroelastomer seals, or replacement covers. For replacement EPDM pressure seals, ask for 4355T86 for standard-mouth tanks or 4355T87 for wide-mouth tanks.

Composite Pressure Tanks

Just as reliable as steel tanks, yet these fiberglass/epoxy composite tanks are corrosion resistant and about half the weight. Great for use in areas where weight, moisture, contamination, and chemical resistance are concerns.

Tanks have aluminum-bronze fittings. Maximum pressure is 150 psi. Temperature range is –20° to +150° F. Connections are NPT female. Not rated for vacuum. Color is gray.

Portable Pressure Tanks

Take these lightweight, easy-to-carry tanks wherever you need them. Bodies are made of steel. Not rated for vacuum.

Vertical tanks are manufactured in accordance with Department of Transportation (D.O.T.) standards. Protective handles guard the valve and pressure gauge. Tanks include a 4-ft. hose with ⅛″ NPT male fitting on one end and an air chuck on the other end. Pressure gauge reads 0-160 psi. Maximum temperature is 180° F.

Horizontal tanks have welded steel legs and a carrying handle. *Mil. spec. model* meets MIL-T-45169E for portable compressed air vessels. Includes 4-ft. hose with ½″ NPT male fitting on one end and an air chuck with safety valve on the other end. Pressure gauge reads 0-200 psi. Not rated for temperature. *ASME-code model* meets ASME pressure vessel code and OSHA standard 1915. Includes a 6-ft. hose with ¼″ NPT male fitting on one end, air chuck on the other end, and ⅜″ hose ferrules on both ends. Pressure gauge reads 0-160 psi. Maximum temperature is 250° F. *ASME-code models with wheels* meet ASME pressure vessel code. They have two openings (¼″ and ½″ NPT female) and a ¼″ NPT female drain. Do not include gauge or hose. Maximum temperature is 450° F.

Pancake tanks are shorter, so they're less likely to tip over. Do not include a gauge or hose. *Standard model* has three NPT female openings (two ¼″ and one ½″). Not rated for temperature. *ASME-code models* meet ASME pressure vessel code. They have three NPT female openings (two ⅛″ and one ¼″). Temperature range is –20° to +450° F.

Expansion Tanks

Use these tanks to accommodate the expansion of heated water and provide a cushion of compressed air in closed water-heating systems. They prevent water loss by eliminating the need to expel hot water from systems during each heating cycle.

All of these tanks can be used vertically as well as horizontally. Openings are NPT female, unless noted.

Miniature Type 304 Stainless Steel Tanks

Offering excellent corrosion resistance, these miniature tanks are made of Type 304 stainless steel. A rolling fluoroelastomer rubber diaphragm maintains tank pressure at or near 0 psi, which extends seal life and prevents leakage. Maximum pressure is 15 psi. Maximum operating temperature is 350° F. Opening is NPT male.

Cap., cu. in.	Opening Pipe Size	(A)	Wall Ga.		Each

Water-Storage Tanks

Steel ASME Hydropneumatic Storage Tank

End View

These tanks can be used both vertically and horizontally as hot- and cold-water storage tanks. Openings are NPT female.

Steel ASME Hydropneumatic Storage Tank— You can also use this tank vertically as a hydropneumatic water storage tank. It's 11-ga. galvanized steel. Max. pressure is 125 psi. Max. operating temp. is 160° F.

Galvanized-Steel Water Storage Tanks— These tanks can be used as water heaters when used with a heat source (see our immersion heaters on pages 518-522). All are 14-ga. steel and hot-dipped for corrosion resistance. Max. pressure is 75 psi. Max. operating temp. is 450° F.

Safety Shut-Off Air-Operated Control Valves

In the event of an air signal loss, a spring shuts these valves off and prevents air from entering your cylinder. Valves are 2-way/2-position (normally closed), which are most often used for double-acting air cylinders. They have three ports. Valves move into position when compressed air is supplied; once air supply is turned off, valves return to their original position via an internal spring. Operating pressure is 0-150 psi. Minimum control (pilot) port pressure is 45 psi at an operating pressure of 90 PSIG. Not rated for vacuum.

Max. scfm @ 100 psi	Coefficient of Volume	Outlet Port, NPT Male	Control (Pilot) Port, For Tube OD	Inlet Port, For Tube OD		Each	Inlet Port, NPT Female		Each

About Air Preparation

High-pressure air isn't all you get when you use a compressor—you also get contaminants such as water, dirt, and oil. Before using compressed air, it should be filtered, properly regulated, and in some cases, lubricated. Correctly prepared air ensures the quality and service life of air-powered tools.

Moisture Removal— The first step toward dry air starts with aftercoolers, moisture separators, and air dryers. Placed after the compressor, these units remove moisture from the compressed air before it enters your system. *Aftercoolers* lower the compressed air temperature, while *moisture separators* dispose of the condensation that occurs during this process. *Air dryers* finish the job by removing remaining moisture through the use of desiccant, refrigerant, or membrane technology.

Filters— Once you've cooled your air and removed the majority of moisture, it's necessary to filter out the remaining dirt particles, oil, vapors, and other damaging elements. Air filters remove solid particles and any remaining water from your system, while oil-removal (coalescing) filters remove oil mist. Some filters also remove odors and bacteria. Filters are installed upstream of regulators and lubricators to protect them from contamination.

Regulators— Regulators lower the pressure of compressed air to increase performance, save energy, and ensure the continuous, safe operation of your air-powered tools. The desired outlet pressure generally is set by turning a knob or screw located on the regulator or by use of a control signal. Relieving-style regulators exhaust excess downstream pressure; nonrelieving regulators do not.

Lubricators— An air lubricator provides point-of-use lubrication. Lubricators introduce oil droplets into the compressed air stream at a controlled rate, which reduces wear and friction in valves and air-powered tools and equipment.

Filter/Regulator/Lubricators— Also known as FRLs, these units combine a filter, regulator, and lubricator into a compact design.

Aftercoolers & Moisture Separators

Inline Water-Cooled Aftercoolers

Connect this aftercooler to your cold-water line to cool hot compressed air coming from your compressor—no electricity needed. All cool air to within 15° F of the inlet water. A cooling water flow rate of 3 gpm per 100 scfm of air flow is required. The cooling action condenses the majority of damaging water. A moisture separator with drain is required to collect condensed water (such as 43775K51-K55, sold separately on this page). A copper tube and brass shell assembly reduces corrosion. Cast iron end caps are removable for easy cleaning. Max. temperature is 250° F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female.

To select the proper aftercooler size, make sure your compressed air system has a lower flow rate (in scfm) than the values listed below.

Max. scfm @ 100 psi	Pipe Size Air	Pipe Size Water	O'all Size, Ht.×Wd.×Dp.		Each
40	1½"	½"	3½"×2⅝"×33⅜"	43865K76	$358.33
80	1½"	½"	3½"×2⅝"×42⅜"	43865K77	410.19
150	1½"	½"	3½"×2⅝"×51⅜"	43865K78	438.89
310	2½"	1"	6¼"×5¼"×50 13/32"	43865K79	851.75

Versa-Mount Fan-Cooled Aftercoolers

Mount these aftercoolers on the floor, wall, or suspend them from the ceiling. Brackets provided (unless noted).

Aftercoolers use a fan to cool hot air coming from your compressor. The cooling action condenses most of the damaging water from your compressed air system. A moisture separator with drain is required to collect condensed water (such as 43775K51-K55, sold separately on this page). Scfm ratings are based on cooling hot compressed air to within 15° F of the ambient air. Max. temp. is 250° F.

Units have a heat exchanger with aluminum fins and copper tubing. All have a steel housing and a 1/12-hp, single-phase motor that operates at 115 VAC, 60 Hz, except 5171K55 which has a 1/4-hp motor. Motor is UL recognized and CSA certified. Max. air pressure is 250 psi. Inlet and outlet connections are NPT male.

To select the proper aftercooler size, make sure your compressed air system has a lower flow rate (in scfm) than the values listed below.

Max. scfm @ 80-125 psi	Pipe Size	O'all Size, Ht.×Wd.×Dp.		Each
20	½"	22"×20⅜"×9 9/16"	5171K51	$444.12

Moisture Separators

43775K51-K55

4997K

2499K

43775K16-K22

Great for water separation downstream of your compressor and aftercooler, these units are designed for use in compressed air systems where excessive water condensation is a problem. Internal baffles separate bulk water from your system. Inlet and outlet connections are NPT female (unless noted).

Separators with Internal Automatic Drain— Separators with a *cast zinc housing* have a max. temperature of 150° F. Separators with a *cast aluminum housing* have a max. temperature of 100° F. Inlet connection is NPT female. Outlet connection is NPT male.

Separators with External Automatic Drain— Offer more clog resistance than internal models. Housing is zinc and aluminum (body is zinc; bowl is aluminum). Drain is bronze. Max. temperature is 120° F.

Separators without Drain— Offer high flow rates and plumbing versatility. Housing is cast aluminum. Max. temperature is 176° F.

Optional *automatic drain* is sold separately below.

Max. scfm @ 100 psi	Pipe Size	Max. Pressure	O'all Size, Ht.×Wd.×Dp.		Each

Automatic Drain for Separators w/out Drain **9831K18** **Each** $202.29

For information about air preparation, see page 963.

Inline Moisture Separators with Oil-Removal Filter

Ideal for use downstream of your compressor or at the point of use in applications that don't require the use of an aftercooler, these units remove solids and liquids that are 3 microns and larger and oil droplets down to 5 ppm. Filter is blended fiber with a stainless steel core. All have an automatic drain, a liquid level indicator, and a filter service indicator. Body and bowl are aluminum. Max. temperature is 150°F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female.

Max. scfm @ 100 psi	Pipe Size	O'all Size, Ht.×Wd.×Dp.	Separators	Each	Repl. Filter Elements	Each
20	3/8"	8"×4"×4"	7341K31	$190.17	7341K1	$41.45
20	1/2"	8"×4"×4"	7341K32	190.17	7341K1	41.45
35	1/2"	11"×4"×4"	7341K34	210.00	7341K2	51.27

100	3/4"	15"×5"×5"	7341K37	323.79	7341K4	84.00
100	1"	15"×5"×5"	7341K38	323.79	7341K4	84.00

Moisture Separators with Oil-Removal Filter

Separators remove oil from water using a combination of gravity, oil-absorbing filters, and activated carbon filters—no need for electricity or external power. Oil is collected in a separate container, allowing you to safely dispose of the oil-free (99.9%) water, while a large settlement chamber accumulates dirt particles and can be easily removed for cleaning. Separators also have a tap for sampling water without disconnecting the outlet piping.

Multiple inlet connections allow you to connect several compressed air components, such as moisture drain valves, separators, aftercoolers, dryers, and filters. Body is polyethylene. Max. temperature is 95°F. Max. pressure is 232 psi. Attach hose to inlets and outlets with a hose clamp.

Replacement filter kit includes the prefilter and carbon filter bag necessary for one replacement.

Max. scfm @ 100 psi	Inlet Hose Barb OD (Qty.)	Outlet Hose Barb OD	Overall Size, Ht.×Wd.×Dp.	Water Reservoir Cap., gal.	Oil Reservoir Cap., gal.		Each
106	1/4" (1), 1/2" (1)	1"	32"×14"×17"	16	1.3	2479K11	$629.85

Replacement Filter Kit						2479K21	166.67

High-Pressure Self-Activating Moisture Drain Valves

High pressures are no problem for these drain valves. They can handle up to 600 psi—with no electricity needed. Back pressure from compressed airflow activates the disc, allowing moisture to escape. Moisture is atomized on discharge to avoid accumulation, eliminating the need for discharge piping. A muffler minimizes noise. To install, connect to your aftercooler, moisture separator, compressed air tank, dryer, or filter. Mount vertically if used outdoors to ensure that unit won't freeze. Body is steel; internal parts are stainless steel. All meet OSHA noise requirements. Max. temperature is 220°F. Inlet and outlet connections are NPT female.

Discharge Cap. @ 100 psi, gpm	Pipe Size	Overall Size, Ht.×Wd.×Dp.		Each
0.4	3/8"	5" ×2 17/32"×2 17/32"	4372K5	$185.74
0.4	1/2"	5 1/2"×2 17/32"×2 17/32"	4372K8	185.74
Replacement Muffler for 4372K5			4372K3	22.33
Replacement Muffler for 4372K8			4372K4	27.57

Compressed-Air-Activated Moisture Drain Valve

Piston-powered valve automatically drains moisture each time your compressor cycles. It is activated by compressed air via a 1/8" NPT female pilot port (no electricity required).

Connect to your aftercooler, moisture separator, compressed air tank, dryer, or filter. Body has a rugged cast aluminum construction. Max. temperature is 150°F. Max. pressure is 200 psi. Inlet and outlet connections are NPT female.

Discharge Cap., gpm	Pipe Size	Overall Size, Ht.×Wd.×Dp.		Each
0.25	1/4"	3 3/4"×2 1/8"×2 1/8"	4919K13	$50.81

Self-Activating Moisture Drain Valves

Also known as drip legs, these low-maintenance drains require no electrical power. They consist of a bowl and a float that automatically opens the drain when bowl begins to fill. Install them at low points in your piping; connect to your aftercooler, moisture separator, compressed air tank, dryer, or filter. Drains on all except Styles C and G can be opened manually and easily serviced without removing them from the air line. Inlet and outlet connections are NPT female, unless noted.

(A&B) Valves with Polycarbonate Bowl—Bowl is transparent to view moisture level. *Style B* has an external drain and can handle oil sludge and large particles. It has a polyethylene bowl guard and bronze drain.

(C) Valve with Nylon Bowl—Resistant to compressor oils and aggressive cleaners. Bowl is transparent for easy viewing of moisture level.

(D) Valve w/Zinc Bowl—Has a sight glass for easy inspection.

(E) Valves w/Aluminum Bowl—Have a compact top-mount design.

(F) Valves with Cast Aluminum Bowl—Have a high-capacity side-mount valve, making them suitable for rugged environments.

(G) Valve with Stainless Steel Bowl—Offers the highest temperature and pressure capacity with excellent corrosion resistance.

	Bowl Material	Discharge Cap., gpm	Pipe Size Inlet	Pipe Size Outlet	Max. Temp.	Max. Pressure	Overall Size, Ht.×Wd.×Dp.		Each

★ Bowl capacity is 3 oz. (discharge capacity not rated). ♦ Outlet has 6 mm OD barb and 10-32 female threads.
♥ Bowl capacity is 5 oz. (discharge capacity not rated).

For information about air preparation, see page 963.

Clog-Resistant Timer-Activated Electric Moisture Drain Valves

A timer gives you the flexibility to specify how often and how long you want to open and close your drain. These valves are better for compressed air systems with high oil content than self-activating float drain valves because they resist clogging when water, oil, and sediment combine to form sludge. Connect to your aftercooler, moisture separator, compressed air tank, dryer, or filter. Inlet and outlet connections are NPT female. All have a 6-ft. cord with three-prong plug (unless noted).

A-C ***Solenoid Valves—*** All have a brass body. *Style A* has a NEMA 1 timer enclosure (for indoor use only) and includes a brass Y-strainer to trap large debris and sludge before it reaches the valve. *Style B* have an IP65 timer enclosure (for indoor use; suitable for washdown applications). *Style C* have a NEMA 4X timer enclosure (for indoor and outdoor use; suitable for washdown applications and exposure to corrosive agents).

D&E ***Ball Valves—*** More heavy duty than solenoid valves and resist clogging even better. Choose from bronze, Type 316 stainless steel, or nickel-plated brass bodies. *Style D* have a NEMA 4X timer enclosure (for indoor and outdoor use; suitable for washdown applications and exposure to corrosive agents). *Style E* are suitable for indoor use.

Optional strainers prevent debris from clogging valves. They are hand operated so it's easy to disconnect flow to the valve. Body is brass. Internal filter screen is Type 304 stainless steel. Connections are NPT male; inlet is 1/2"; outlet is 1/4" for 4389K37 and 1/2" for K38. Max. pressure is 600 psi.

■ Has a manual override switch. ● No cord or plug. ✓ Has a 7-ft. cord with three-prong plug.
♦ Has an 8-ft. cord with three-prong plug, except 9831K22 which has no plug. ♣ Per 15-minute interval.

Ultra-Flow Sensor-Activated Electric Moisture Drain Valves

Designed for very high flow capacities, valves have an internal sensor that detects when liquid is drained from the chamber, then closes the valve before air escapes to save energy. Connect to your aftercooler, moisture separator, compressed air tank, dryer, or filter. To avoid excessive cycling, use in air systems that have an airflow less than the max. scfm listed below. All have a 6-ft. cord with three-prong plug.

F&G Clear sludge formed by water, oil, and sediment and have an alarm with remote contact that you can connect to a signaling device for early warning of problems. Valves have two inlet connections, letting you connect two components at the same time. Body is stainless steel and copper. Operate on 115 VAC, 50/60 Hz.

H Body is polyamide. Operates on 115 VAC, 50 Hz.

	Max. scfm @ 100 psi	Discharge Cap., gpm	Inlet Pipe Size	Outlet Size	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.×Dp.		Each

Emergency Stop Valves

Also known as Monday-morning valves, these solenoid valves increase pressure slowly (time adjusts from 1 to 20 seconds) to reduce surge damage. The solenoid cuts air to your equipment by evacuating downstream pressure through an exhaust port. Body is made of aluminum. Muffler is included. Maximum temperature is 150°F. Maximum pressure is 150 psi. Size is 7.32" Ht. ×2.7" Wd. Connections are NPT female.

Pipe Size Inlet	Pipe Size Outlet	Max. scfm @ 100 psi	24-VDC Valves	Each	120-VAC Valves	Each

Inline Disposable Desiccant Air Dryer

It's the disposable razor of desiccant air dryers—just throw it away when the desiccant changes color. Designed for inline, point-of-use applications, this economical dryer has a transparent polycarbonate bowl for easy viewing. Desiccant material is silica gel and changes from orange to green when replacement is needed. Dries air to a –30°F dew point.

Includes a 40-micron prefilter and can be installed vertically or horizontally. Max. temperature is 130°F. Max. pressure is 125 psi. Inlet connection is NPT female. Outlet connection is NPT male.

Max. scfm	Pipe Size	O'all Size, Ht.×Wd.		Each
15	1/4"	3 3/4" × 1 45/64"	7793T1	$12.72

For information about air preparation, see page 963.

Desiccant Air Dryers

With Polyurethane Body
5164K77 5164K76

With Zinc Body and Polycarbonate Bowl

With Zinc Body and Aluminum Bowl

With Aluminum Body and Steel Bowl

Nothing fancy here . . . just tried and true removal of moisture from your compressed air system. Dryers come with one desiccant fill and should be installed at the point of use for best performance.

Dryers with Polyurethane Body— Offer excellent resistance to synthetic compressor lubricants, hydrocarbons, solvents, acids, and other chemicals. Dryers remove moisture, oil, and oil vapor. A built-in filter captures particles down to 0.3 microns in size. Bowl is transparent, allowing for easy monitoring of the desiccant. Desiccant is clay and darkens when saturated. Dryers can be mounted vertically and horizontally. Max. temperature is 180° F. Max. pressure is 250 psi.

5164K77 is a disposable one-piece unit. Desiccant cannot be regenerated or replaced. Inlet and outlet connections are NPT female. 5164K76 has a two-piece housing with built-in mounting bracket. Desiccant can be replaced but not regenerated. Inlet and outlet connections are NPT male.

Dryers with Zinc Body— Desiccant is silica gel and changes from blue to pink when replacement or regeneration is needed. To regenerate, heat desiccant for three hours at 350° F. Inlet and outlet connections are NPT female.

Dryers with *polycarbonate bowl* have a transparent bowl that makes it easy to see when desiccant is saturated. Bowl guard is black powder-coated aluminum, unless noted. Max. temperature is 125° F. Max. pressure is 150 psi.

Dryers with *aluminum bowl* have a moisture indicator to monitor desiccant saturation. Max. temperature is 150° F. Max. pressure is 150 psi.

Dryers with Aluminum Body— Have a sight glass indicator to monitor desiccant saturation. Desiccant is silica gel and changes from blue to pink when replacement or regeneration is needed. To regenerate, heat for one hour at 275° F. Max. temperature is 120° F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female.

▲ Max. scfm @ 100 psi. ● Dryers lower inlet air dew point by 20%. ♠ Bowl guard is aluminum.
■ Requires three replacement desiccant elements.

High-Flow Desiccant Air Dryers

Clear Acrylic Cylinder

Aluminum Cylinder w/Sight Glass

Higher air flow capacities allow these dryers to be used on main compressed air lines servicing multiple end uses. The bottom inlet and top outlet have NPT female connections for inline mounting. Max. temperature is 150° F. Cylinders come filled with desiccant.

Dryers with Clear Acrylic Cylinder— Transparent cylinder allows you to easily see when desiccant changes color and must be replaced or regenerated. Max. pressure is 150 psi.

Dryers with Aluminum Cylinder— Offer increased protection from vapors and liquids that could weaken plastic cylinders. Max. pressure is 250 psi. *Aluminum cylinders with sight glass* let you see when desiccant changes color and must be replaced or regenerated.

Clay desiccant traps water, oil vapor, hydrocarbons, and particulates. Desiccant is grayish-brown and darkens when saturated, letting you know it must be discarded (desiccant cannot be regenerated). Dryers that use clay desiccant lower input air dew point by 20%.

Silica-gel desiccant is extra absorbent and designed only for moisture removal. Dryers that use silica-gel desiccant lower input air dew point by 40%. Desiccant changes color from blue to pink when saturated. To regenerate desiccant, heat at 220° F for two hours.

Desiccant Air Dryers with Oil-Removal Filter

When air first enters the dryer, an oil filter traps larger particles and droplets of oil and water to reduce desiccant contamination. The desiccant then absorbs the oil and water and removes solid particles as small as 0.3 microns. Dryers lower dew point of inlet air by 20% and should be installed at the point of use.

All have a transparent polyurethane bowl that lets you easily see when the desiccant changes color and must be replaced (desiccant cannot be regenerated). Desiccant is made of clay and darkens when saturated. All units come with one desiccant fill and have a manual drain. Body is polyurethane. Max. temperature is 180° F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female.

Max. scfm @ 100 psi	Pipe Size	O'all Size, Ht. × Wd.	Dryers	Each	Repl. Desiccant	Each	Repl. Filter Elements	Each
20	1/2″	10 9/16″ × 4 5/8″	4386K6	$447.27	4386K41	$29.42	4386K11	$48.45

★ Requires two replacement desiccant elements.

For information about air preparation, see page 963.

Heavy Duty Desiccant Air Dryers

Dryers handle higher flows and higher pressure than standard desiccant dryers. A built-in sight glass monitors desiccant condition. All have a bronze filter element (90 micron on the 15- and 30-scfm models; 40 micron on the 60-scfm models). Silica gel desiccant (sold separately) changes color from blue to pink when saturated. Regenerate desiccant by heating at 350° F. All have a zinc body and aluminum bowl (unless noted). Max. temperature is 180° F. Max. pressure is 300 psi. Inlet and outlet connections are NPT female.

Self-Regenerating Desiccant Air Dryers

Compact, all-in-one design with two internal desiccant towers...one dries your air while the other automatically regenerates to give you an uninterrupted compressed air supply, dried to a dew point of –40° F. Each unit has a high-efficiency 0.01-micron oil-removal prefilter, two combination desiccant and 1-micron particle filter cartridges, an automatic drain, and an electronic display. An audible alarm lets you know when it's time for service. Quick-release top caps make it easy to replace filter cartridges and service the dryer without disconnecting the air connections. Install at the point of use. Housing is aluminum. Max. temp. is 122° F. Max. pressure is 174 psi. Inlet and outlet connections are NPT female. Dryers operate on 115 VAC, 60 Hz, single-phase power. ***Maintenance kits*** include replacement desiccant, automatic drain, and filter elements.

Max. scfm @ –40° F Dew Point	Pipe Size	O'all Size, Ht. × Wd. × Dp.	Dryers	Each	Maintenance Kits	Each

Refrigerated Air Dryers

Standard

3-in-1 Combination

Dryers cool air with R-134a refrigerant, then expel the moisture through an automatic drain. Designed for mainline use. All include a power-on light and dew point indicator. Inlet and outlet connections are NPT female. Operate on a 115 VAC, 60 Hz, single-phase motor and have a 6-ft. cord with three-prong plug.

Standard— Install after your aftercooler or moisture separator. Max. temp. is 140° F. Max. pressure is 232 psi.

3-in-1 Combination— Eliminate the need for a separate aftercooler, moisture separator, and drain with these dryers, which combine all those functions into a single unit. Max. temperature is 200° F. Max. pressure is 232 psi.

Ultra-Clean Membrane Air Dryers

No desiccant, refrigerant, or electricity required and no moving parts to wear out—membrane technology gives you extra-clean, dust-free, instrumentation-quality air. Install at point of use. Units have a compact design and easy connect/disconnect features. Use them with the Wilkerson line of modular compressed air preparation products (see 60115K, page 978). They dry air to a dew point of –40° F. Each dryer includes a 0.01-micron oil removal filter with automatic drain. For optimum life, install a 5-micron particle filter (sold separately below) before the oil-removal filter. Body is zinc. Bowl is aluminum. Max. temperature is 125° F. Max. pressure is 150 psi. Inlet and outlet connections are NPT female.

Max. scfm @ Lowest Dew Point	Pipe Size	O'all Size, Ht. × Wd. × Dp.	Dryers	Each	Replacement Filter	Each

5-Micron Particle Filter for Dryers ..... 60115K73 **Each** $57.64

For information about air preparation, see page 963.

High-Pressure Miniature Inline Air Filters

Anodized Aluminum

Brass

Compact point-of-use air filters easily handle high pressures, while replacement filter elements make them an economical choice. Connections are NPT female (unless noted).

Anodized Aluminum Body—A bronze element removes particles as small as 40 microns. Max. temperature is 200° F. Max. pressure is 500 psi. 4414K32 and 4414K33 have one NPT male connection and one NPT female connection.

Brass Body—A cotton and stainless steel element removes particles as small as 5 microns. Max. temperature is 180° F. Max. pressure is 250 psi.

Air Filters

A

B

C

D

E

F

Remove solid particles and water from your compressed air. Inlet and outlet connections are NPT female. Choose *filters with automatic drain* if you have large quantities of water.

A Standard—A polypropylene element removes particles as small as 5 microns (unless noted). All have a service indicator. Filters can be pipe nipple connected or used in Norgren clamp-style modular filter/regulator/lubricators. Body and bowl are aluminum (unless noted).

B Easy View—A clear bowl lets you see what's being filtered. All have a plastic element that removes particles as small as 5 microns. Body is zinc. Bowl is polycarbonate and has a zinc bowl guard, except 4274K91-K94 which do not have a bowl guard.

C Chemical Resistant Easy View—A clear polyurethane bowl offers increased chemical compatibility and won't crack in systems heavy with synthetic compressor oils and cleaning liquids. All have a polypropylene element that removes particles as small as 5 microns. Body is brass.

D Corrosion Resistant Easy View—Have an aluminum body for increased corrosion resistance and a clear polycarbonate bowl that lets you see what's being filtered. All have a polypropylene element that removes particles as small as 20 microns.

E Ultra Corrosion Resistant—Body and bowl are Type 316 stainless steel, making this filter perfect for extremely corrosive environments like those found in the semiconductor, pharmaceutical, marine, chemical, and paper industries. Filter with *1/4″ pipe size* has a polypropylene element that removes particles as small as 20 microns. Filter with *1/2″ pipe size* has a polyethylene element that removes particles as small as 40 microns.

F Lightweight Ultra Fine—Highly efficient all-plastic filter has a submicronic borosilicate glass element that removes particles as small as 1 micron. A clear polyurethane bowl lets you see what's being filtered. Acetal body offers corrosion resistance and increased chemical compatibility.

● Unit is up to 0.6″ taller. ♣ Body and bowl are zinc. ★ Has a sintered bronze filter element.

Disposable Inline Air Filters

9842K11, K31

9842K9

Just throw these point-of-use compressed air filters away after you're done with them. Each has an adsorbent activated-carbon element to remove vapors, aerosols, and particles as small as 0.5 micron. Body and bowl are steel. Max. temperature is 200° F. Inlet and outlet connections are NPT male.

Pipe Size	Max. scfm @ 100 psi	Max. Pressure	O'all Size, Lg.×Wd.		Each 1-2	Each 3-Up

1/2″	11.5	250 psi	8 3/8″×3″	9842K31	70.95	60.03

♦ Max. scfm @ 90 psi.

Super Ultra-Fine Submicron Air Filters

9841K91

Not much gets by these filters. Designed for ultra-fine filtration of particles and mists, they remove oil aerosols, smoke, condensed moisture, and contaminants as small as 0.01 micron from compressed air and vacuum lines. Filters have a high wet-strength element that consists of a roll of cellulose wound on a polyethylene core.

Housing is cast aluminum coated with epoxy for corrosion resistance. Max. temperature is 175° F. Max. pressure is 125 psi. Inlet and outlet connections are NPT female. 9841K91 includes a mounting bracket.

Pipe Size	Max. scfm @ 100 psi	O'all Size, Ht.×Wd.	Complete Units	Each	Repl. Filter Elements	Each

1/2″	110	7″×5″	9841K92	102.88	9841K93	9.53

For information about air preparation, see page 963.

Ultra-Fine Rough-Service Air Filters

A specially designed Type 304 stainless steel element handles extra-rough, dirty compressed air and removes moisture and particles as small as 1 micron. All have an automatic float-style drain and a service indicator that alerts you when filter must be replaced (unless noted). Max. temperature is 125° F. Max. pressure is 150 psi. Inlet and outlet connections are NPT female. Body is zinc; choose from aluminum bowl and polycarbonate bowl with steel bowl guard.

Class 100 Clean Room Air Filters

Manufactured, cleaned, and packaged in a Class 100 clean room, filters are ideal for the exhaust of your clean-room compressed air equipment. Also ideal in clean rooms where new machinery has been installed that may contain some internal impurities. All have a polyolefin element that removes particles as small as 5 microns. Body is cast aluminum. Bowl is polycarbonate with aluminum bowl guard and a drain guide. Also include a mounting bracket. Max. temperature is 140° F. Max. pressure is 145 psi. Inlet and outlet connections are NPT female.

Pipe Size	Max. scfm @ 100 psi	O'all Size, Ht.×Wd.		Each
1/4"	980	5.08"×1.57"	7279K5	$40.36
3/8"	980	5.08"×1.57"	7279K6	40.36
1/2"	1652	6.50"×2.76"	7279K7	51.63
3/4"	1652	6.50"×2.76"	7279K8	54.41

Miniature Inline Oil-Removal Air Filters

These tiny and tossable coalescing filters use a borosilicate glass element to remove particles as small as 0.6 micron, 95% of oil mist, and aerosols down to 0.85 ppm. Housing is clear nylon. Max. temperature is 125° F. Max. pressure is 100 psi. Inlet and outlet connections are not threaded; connect using hose or tube.

Filter ***with oil-activated dye element*** turns red when oil is present, making it great for use as a "fuse" to alert you if your main oil-removal filter fails.

Inlet/Outlet OD	Max. scfm @ 100 psi	O'all Size, Dia.×Lg.		Each
Standard				
1/4"	3.5	1"×3.28"	41575K57	$10.20
1/4"	5.3	1"×3.28"	41575K58	10.19

1/4"	3.2	1"×3.28"	41575K59	10.19

Oil-Removal Air Filters

Remove oil mist and aerosols from your compressed air with these coalescing filters. Inlet and outlet connections are NPT female.

A&B Standard—Have a synthetic fiber/polyurethane foam element that removes oils, particles, and aerosols down to 0.01 ppm. Filters can be pipe nipple connected or used in Norgren clamp-style modular filter/regulator/lubricators (unless noted). Body and bowl are aluminum. Have an automatic drain. Max. temperature is 150° F. Max. pressure is 250 psi.

Style B have a service indicator that changes from green to red when the filter element needs to be changed.

C Easy View with Service Indicator—A transparent bowl lets you see what's being filtered, while a service indicator changes from green to red to alert you when the filter element needs to be changed. All have a borosilicate glass element that removes 99.99998% of oil and aerosols and grabs particles as small as 0.01 micron. Body is zinc. Bowl is polycarbonate and has a steel bowl guard. Have an automatic drain. Max. temperature is 125° F. Max. pressure is 150 psi.

D Chemical Resistant Easy View—Similar to Style C, filters have a transparent bowl so you can see what's being filtered. A borosilicate glass element removes 99.97% of oil and aerosols and grabs particles as small as 0.3 micron. Body is brass. Bowl is clear and made of chemical-resistant polyurethane, making it suitable for use in systems with synthetic compressor oils and aggressive cleaning agents. Have a manual drain. Max. temperature is 120° F. Max. pressure is 150 psi.

E Ultra Corrosion Resistant—Type 316 stainless steel body and bowl are ideal for extremely corrosive environments. All meet NACE (National Association of Corrosion Engineers) specifications. A borosilicate glass element removes 99.97% of oil and aerosols and grabs particles as small as 0.3 micron. Have a manual drain. Max. temperature is 180° F. Max. pressure is 300 psi.

♣ Pipe nipple connection only. ♦ Max. scfm @ 90 psi.

For information about air preparation, see page 963.

Particulate Air Filters with High-Capacity Automatic Drain

If you have severe moisture problems, these coalescing filters are the perfect solution. An external automatic drain will discharge up to 300 gallons per hour. Filters remove particles as small as 5 microns. All have a polycarbonate bowl with steel bowl guard, except 4267K23 which has an aluminum bowl. Inlet and outlet connections are NPT female.

Zinc Body—Have a polypropylene element. Max. temperature is 125° F. Max. pressure is 150 psi.

Aluminum Body—Filters with *¾″-1″ pipe sizes* have a polypropylene element. Max. temperature is 125° F. Max. pressure is 150 psi. Filter with *2″ pipe size* has a bronze element. Max. temperature is 175° F. Max. pressure is 200 psi.

Particle- and Oil-Removal Air Filters

Get two stages of air filtration—the first stage is a polypropylene element that removes water droplets, oil, and rust particles; the second stage is a cotton and stainless steel coalescing element that captures remaining water droplets, oil, and other particles as small as 5 microns. Both stages have manual drains. Max. temp. is 180° F. Max. pressure is 250 psi (unless noted). Inlet and outlet connections are NPT female.

Complete units include filters, base core, base gasket, four cap gaskets, and a pressure differential gauge to indicate when filter needs to be serviced (unless noted). ***Replacement element kits*** include first- and second-stage elements, base core, one base gasket, and four cap gaskets.

■ Pressure differential gauge not included. ▲ Max. pressure is 150 psi.

Ultra-Fine Particle- and Oil-Removal Air Filters

A

B

C

Efficiently combine two stages of filtration into one handy unit. Stage one removes larger particles and stage two uses a coalescing filter to remove finer particles of moisture and oil. Inlet and outlet connections are NPT female.

(A) Corrosion Resistant—Stage one removes particles as small as 1 micron and oil droplets down to 0.5 ppm; stage two removes finer particles as small as 0.01 micron and oil droplets down to 0.01 ppm. Filter elements are borosilicate glass. Drain can function constantly or intermittently. Body is lightweight nylon. Bowl is clear polyamide for easy viewing.

(B) High Flow—Stage one removes particles as small as 5 microns; stage two removes oil droplets down to 0.5 micron/0.01 ppm. Filter elements are polyethylene (stage one) and borosilicate cloth (stage two). Drains are automatic, except 8075T1 which has a manual drain. Filters can be pipe nipple connected or used in Wilkerson clamp-style modular filter/regulator/lubricators. Body and bowl are zinc (unless noted).

(C) Heavy Duty—Perfect for extra-rough, dirty environments. Units remove bulk water and contamination as small as 1 micron by passing the air first over a Type 304 stainless steel element and then a cotton/polyester element. A side-by-side configuration lets you service the filters separately. All have an automatic drain on the first-stage filter and a manual drain on the second-stage filter. Body is zinc and bowl is polycarbonate with a steel guard.

● Bowl is polycarbonate.

Ultra-Fine Particle-, Oil-, and Bacteria-Removal Filters

With one compact unit you can remove oil, water, dirt, and bacteria from your compressed air. The first stage removes oil, water, and dirt and has an automatic drain. The second stage removes trace quantities of oil, water, and dirt (as small as 0.01 micron) with 99.99% efficiency; it also has an automatic drain. The third stage removes bacteria to yield extra-clean air. No drain is needed at the third stage. Filter elements are borosilicate glass. All have a service indicator on the first-stage filter and are constructed of FDA-compliant materials. USDA-accepted for use in meat and poultry plants. Body and bowl are aluminum, except 1309K14 which has a steel bowl. Max. temperature is 130° F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female.

Oil Vapor- and Odor-Removal Air Filters

To remove the smallest traces of oil vapor and odor, use these filters as the last step in your air preparation system; install after a 5-micron particle filter and an oil-removing filter. An activated carbon element absorbs oil vapor and its associated odors. Ideal for food processing and packaging, pharmaceuticals, and other industries where very high quality air is critical. Body and bowl are zinc (unless noted). All have a manual drain. Max. temperature is 150° F. Max. pressure is 200 psi. Filters can be pipe nipple connected or used in Wilkerson clamp-style modular filter/regulator/lubricators. Inlet and outlet connections are NPT female.

★ Bowl is aluminum.

For information about air preparation, see page 963.

Ultra-Fine Modular Air Filters

Choose one or more of these modular filters to create your own high-pressure/high-flow filtration system. Connectors (sold separately as a kit below) let you connect and disconnect components for fast installation and maintenance. All filters have an aluminum body and bowl, and a service indicator to alert you when the filter element must be changed, unless noted. Max. temperature is 176° F, unless noted. Max. pressure is 232 psi. Inlet and outlet connections are NPT female.

Particle filters remove particles as small as 1 micron and separate water using a glass microfiber element. Include an automatic drain.

Oil-removal (coalescing) filters have a glass microfiber element to create virtually oil-free air and are rated to 0.01 micron. Include an automatic drain.

Oil vapor-removal filters are ideal for food and drug applications requiring removal of oil vapors and odors. Filters are rated to 0.003 ppm and have an activated carbon element. Max. temperature is 104° F.

Connector kits include two bolts, two nuts, and two O-rings.

Particle Filter

Oil-Removal Filter

Oil Vapor-Removal Filter

Also Available: Replacement filter elements. For particle filter elements, please ask for 6754K4 and specify pipe size. For oil-removal filter elements, please ask for 6754K5 and specify pipe size. For oil vapor-removal filter elements, please ask for 6754K6 and specify pipe size.

Miniature Air Regulators

Regulate your output air pressure where space is at a premium with these small regulators. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. All have a 1/8″ NPT gauge port. Inlet and outlet connections are NPT female. *Mounting brackets* include mounting nut.

Zinc body is lightweight and economical. Accuracy is ±3 psi. ***Aluminum body*** is lightweight and corrosion resistant. Accuracy is ±1 psi. ***Brass body*** is compatible with water as well as nontoxic, nonacidic chemicals. Accuracy is ±1 psi. ***Acetal body*** is corrosion resistant and FDA compliant. Accuracy is ±1 psi, unless noted.

To Order: Please specify regulating range from those listed in the table.

Miniature Air Regulators with Tube Connections

No need for tools—tube fitting connections make it easy to connect and install these regulators. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±3%. Body is acetal. Units do not have gauge ports. Mounting bracket for regulators with barbed connections and with compression tube fittings includes a mounting nut. Regulators with instant tube fittings also include a mounting nut.

Tamper-Resistant Miniature Air Regulators

A locking ring in the adjustment knob prevents accidental outlet flow changes. Regulators include a gauge and are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Both have an aluminum body and include a mounting nut. Accuracy is not rated. Inlet and outlet connections are NPT female.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd. ♣	Regulators	Each	Mounting Brackets	Each

♣ Dimensions do not include gauge.

For information about air preparation, see page 963.

Nonadjustable Miniature Air Regulators

A

B

C

If you always need the same outlet pressure and don't want anyone to change the settings, these inherently tamper-resistant regulators are perfect because they come set at one nonadjustable outlet pressure. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. All have gauge ports (gauges not included). Accuracy is ±3 psi. Inlet and outlet connections are NPT female.

(A) OSHA-Compliant Air Service— Set specifically to 30 psi outlet pressure and meet OSHA standard 1-13.1. Regulators are designed for compressed air service. Body is zinc.

(B) Air Service— Regulators are designed for compressed air service. Body is aluminum.

(C) Water and Air Service— Suitable for use with both water and compressed air. Body is brass.

To Order: For Styles B and C, please specify outlet pressure setting in 5 psi increments from the range listed in the table.

	Pipe Size	Gauge Port Size	Max. scfm @ 100 psi	Available Outlet Pressure Settings	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.		Each
A	1/4″	1/8″	15	_____	125°F	250 psi	2.88″×1.65″	8078T1	$22.85
A	3/8″	1/4″	35	_____	125°F	250 psi	3.3″ ×2.12″	8078T2	34.07

Inline Miniature Air Regulators

Lever Controlled

Tamper Resistant

Designed for installation directly to your air-powered tool. Connections are NPT female inlet and NPT male outlet.

Lever Controlled— Turn the handle and go from full-line pressure to almost complete shutoff. A gauge on top indicates air pressure at all times. Regulators are nonrelieving style; they have no vent ports so they prevent release of downstream pressure. Accuracy is ±3% for the first third of the range, ±5% for the second third, and ±8% for the last third. Body is brass.

Tamper Resistant— A lock prevents unintentional changes or tampering with the setting. To adjust pressure, turn the collar. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±2.5 psi. Body is aluminum, except 41685K11 which is brass. Units do not have gauge ports.

Pipe Size Inlet	Pipe Size Outlet	Max. scfm @ 100 psi	Regulating Range, psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Lg.		Each
Lever Controlled								
1/4″	1/4″	5	0-150	250°F	150 psi	2″ ×3.25″	4158K72	$26.60
Tamper Resistant

3/8″	1/4″	18	50-145	175°F	150 psi	1.06″×3.875″	41685K17	41.09
3/8″	3/8″	18	50-145	175°F	150 psi	1.06″×3.875″	41685K18	41.23

Panel-Mount Miniature Air Regulator

Super-compact regulator has inlet and outlet ports on the bottom, making it ideal for panel-mount applications (panel mount nut included). Regulator is relieving style, which reduces downstream pressure through a vent port when your system is blocked. Body is corrosion-resistant anodized aluminum. Accuracy is ±0.25 psi. Max. temperature is 160°F. Max. pressure is 250 psi. Inlet and outlet connections are NPT female. Gauge port has 10-32 UNF female threads (gauge not included).

To Order: Please specify regulating pressure range (psi): 0-5, 0-15, 0-30, 0-60, or 0-100.

Pipe Size	Max. scfm @ 100 psi	O'all Size, Ht.×Wd.		Each
1/16″	2.5	3.33″×0.88″	41795K3	$42.43

Nonrelieving Miniature Air Regulators

Nonrelieving means no vent ports, preventing release of downstream pressure. Regulators are also suitable for use with drinkable water. Compact and lightweight, they are made of corrosion-resistant, FDA-compliant acetal.

All have two 1/8″ NPT gauge ports (gauge not included). Accuracy is ±1 psi. Max. temperature is 125°F. Max. pressure is 150 psi. Inlet and outlet connections are NPT female.

To Order: Please specify regulating pressure range (psi): 0-25, 0-60, or 0-125.

Pipe Size	Max. scfm @ 100 psi	O'all Size, Ht.×Wd.		Each
1/8″	18	3.10″×1.60″	6746K41	$25.17
1/4″	18	3.10″×1.60″	6746K42	25.17

Air Regulators

D

E

F

Adjust air pressure to the level you need with these relieving-style regulators. The relieving feature reduces downstream pressure through a vent port when your system is blocked. Inlet and outlet connections are NPT female.

(D) Without Pressure Gauge— Accuracy is ±3 psi. All have a zinc body and two 1/4″ NPT gauge ports (unless noted).

(E&F) With Pressure Gauge— *High-flow regulators (Style E)* have T-handle adjustment for added leverage—great for gloved- or greasy-hand operation. Accuracy is ±3 psi. All have an aluminum body except 4959K51, which has a zinc body. *Damage-resistant regulators (Style F)* have a built-in gauge so they're more resistant to damage in high-traffic areas. Accuracy is ±3%. All have cast aluminum body except 8812K31, which has a cast zinc body.

To Order: Please specify regulating pressure range from those listed when necessary.

● One 1/8″ NPT gauge port.

For information about air preparation, see page 963.

Flexi-Range Air Regulators

Adjustment springs (included) let you choose from 2 to 30, 10 to 50, 30 to 90, and 100 to 180 psi regulating pressure ranges, while a slotted-head adjusting screw lets you change outlet pressure. Regulators are nonrelieving style; they have no vent ports so they prevent release of downstream pressure. Accuracy is ±5%. Body is forged brass. Inlet and outlet connections are NPT female.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	Max. Temp.	Max. Pressure	O'all Size, Ht. × Wd.		Each
1/4″	18	2-180	180° F	300 psi	3 7/16″ × 2 1/4″	4771K2	$85.60
3/8″	18	2-180	180° F	300 psi	3 7/16″ × 2 1/4″	4771K3	85.60

Tamper-Resistant Air Regulators

Prevent unauthorized adjustment with these regulators. Regulators are relieving style, which reduces downstream pressure when your system is blocked. Inlet and outlet connections are NPT female.

(A) Quick Response— A balanced valve diaphragm assures rapid response to inlet pressure changes. All have two 1/8″ NPT gauge ports (one gauge is included). They include a knob for pressure adjustment and a tamper-resistant clip. Accuracy is ±1%. Body is aluminum.

(B&C) Key Lock— A built-in lock means outlet pressure settings remain unchanged, giving these regulators an extra level of security. Just set the desired outlet pressure, lock it, and remove the key to prevent further adjustment. Universal lock design lets you lock multiple regulators with one key. All include a key and a gauge.

Style B have an accuracy of ±3%. Body is cast zinc and aluminum. Furnished with a mounting bracket.

Style C have an accuracy of ±3 psi. Body is zinc. Mounting bracket includes a mounting nut.

(D) T-Handle Lock— Simply set the pressure where you want it, then remove the T-handle key to prevent adjustment. A built-in stop inside each regulator prevents internal damage in the event of a system surge. Regulators are made of die cast aluminum and have two 1/4″ NPT gauge ports (gauges are sold separately at right). Accuracy is ±5 psi. **To Order:** Please specify regulating range from those listed.

Ultra-Corrosion-Resistant Air Regulators

A Type 316 stainless steel body makes these regulators ideal for corrosive environments such as those found in the semiconductor, pharmaceutical, marine, chemical, instrumentation, and paper industries. Regulators meet NACE (National Association of Corrosive Engineers) specification MR 0176-98. All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±1 psi. 4289K11 has two 1/8″ NPT gauge ports; 4289K13 has two 1/4″ NPT gauge ports. Inlet and outlet connections are NPT female. **To Order:** Please specify regulating pressure range from those listed.

Class 100 Clean Room Air Regulators

E

Cleaned and assembled in a Class 100 clean room and double-packed for protection from contamination, regulators are suitable for use in a Class 100 clean room. Ideal for semiconductor, medical, food processing, and other sensitive applications. All regulators include a mounting nut.

(E) With NPT Connections— Suitable for air, nitrogen, carbon dioxide, argon, and water. Regulators are nonrelieving style; they have no vent ports so they prevent release of downstream pressure. Seal is fluororubber. Made of Type 316 stainless steel. Gauge port is 1/4″ NPT (gauge and mounting brackets sold separately below). Accuracy is ±7 psi. Inlet and outlet connections are NPT female.

(F) With BSPT Connections— Regulators are relieving style, allowing reduction of downstream pressure through a vent port when your system is blocked. All have an aluminum body, a brass valve, and NBR rubber seal. Gauge and mounting bracket included. Accuracy is ±3%. Inlet and outlet connections are BSPT female (British Standard Pipe Taper Thread). *Note:* 0.05-0.85 MPa is equal to 7-123 psi. 1 MPa is equal to 145 psi.

Gauge for Style E Regulators ..... 4238K47 Each $65.04

For information about air preparation, see page 963.

Dial-Set Air Regulators

Easily select your outlet pressure with a transparent pressure-calibrated adjustment dial. The compact design is ideal for applications where a protruding gauge may be a problem. Regulators mount in any position, but dial face may not always be visible. All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±0.5 psi. Regulators have a zinc body and two 1/4″ NPT gauge ports (gauge not included). Max. temperature is 150° F. Max. pressure is 300 psi. Inlet and outlet connections are NPT female.

To Order: Please specify regulating pressure range from those listed.

Pipe Size	Max. scfm @ 100 psi	Available Regulating Ranges, psi	O'all Size, Ht.×Wd.		Each

Mounting Bracket				4963K41	8.44

Reverse-Flow Air Regulators

An internal check valve allows for reverse flow, making these regulators suitable for extending and retracting air cylinder applications. All of these regulators are relieving style, except the 10-32 pipe size, which is nonrelieving. Relieving style regulators reduce downstream pressure through a vent port when your system is blocked. Gauge is included. Accuracy is ±3%. Body is aluminum (unless noted). Max. temperature is 140° F. Max. pressure is 145 psi. Inlet and outlet connections are NPT female. Mounting bracket and nut are included.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	O'all Size, Ht.×Wd.		Each
10-32	5	7-102	2.28″×0.98″	4964K21 ♦	$29.99
1/8″	28	7-125	3.70″×2.24″	4964K22 ♦	34.14
1/4″	28	7-125	3.70″×2.24″	4964K23 ♦	35.12
3/8″	52	7-125	4.57″×2.32″	4964K24	45.63
1/2″	105	7-125	5.04″×2.68″	4964K25	56.94
3/4″	353	7-125	6.65″×3.43″	4964K26	89.70

♦ Body is zinc.

Flexi-Max Pressure-Limiting Air Regulators

Designed to let you limit the maximum pressure of your system. Just install the regulator, turn on the air, use an adjustable wrench to set the maximum pressure, and install the adjusting knob by snapping it in place. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Each has two 1/4″ NPSI (NPT-compatible) gauge ports (gauge not included). Accuracy is ±5%. Body is aluminum. Inlet and outlet connections are NPT female.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.	Regulators	Each	Mounting Brackets	Each
3/8″	33	29-109	140° F	232 psi	4.5″×2.5″	9336K31	$76.98	9336K21	$3.80
1/2″	63	29-109	140° F	232 psi	4.5″×2.5″	9336K32	76.98	9336K21	3.80

Precision Air Regulators

Perfect when you need a higher degree of precision repeatability than standard regulators. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Gauge port is 1/4″ NPT. For maximum effectiveness, use with a Grade 1A or better gauge (not included; see 4088K on page 571). Inlet and outlet connections are NPT female. All regulators include a mounting nut.

To Order: Please specify regulating range from those listed.

(A) Standard— Regulators have a high-relief function that quickly exhausts pressure to protect your components in the event of a system blockage. Accuracy is ±0.1%. Body is zinc.

(B) High Flow— Accuracy is ±0.3%. An aluminum body provides good corrosion resistance.

(C) Corrosion Resistant— Regulators have a Type 316 stainless steel body for superior corrosion resistance and meet NACE (National Association of Corrosion Engineers) material requirement MR-01-75. They also have good chemical resistance and are ideal for petrochemical, food processing, and paper mill applications. Accuracy is ±0.1 psi.

	Pipe Size	Max. scfm @ 100 psi	Available Regulating Ranges, psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.	Regulators	Each	Mounting Brackets	Each
A	1/4″	14	2-25, 2-60, 2-120	150° F	150 psi	4.31″×2.12″	6162K13	$114.19	4246K12	$19.25

C	3/8″	20	0-30, 0-60, 0-100, 2-150	180° F	250 psi	6.9″ ×2.5″	1806K2	434.18	1806K3	26.60

Precision Electronic Air Regulators

Electronic regulators convert a current or voltage input signal into a proportional pressure output. As you increase your input signal, output pressure increases within the regulating range listed. Use with any sensor or source capable of producing the required input signal, or a programmable logic controller (PLC) for automatic setting adjustments.

Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Mount vertically. Air inlet and outlet connections are NPT female.

(D) Low Flow— Accuracy is ±0.5%. All have a NEMA 4X enclosure suitable for washdown and outdoor applications. Body is aluminum. Gauge port is 1/4″ NPT (gauge not included). Electric connection knockouts are 1/2″ dia. Mounting bracket is included.

(E) High Flow— Accuracy is ±0.8%. An integral LED indicator on top of each unit displays output pressure. Body is aluminum.

(F) High-Precision Easy-Control— Accuracy is ±0.3%. On-board software enables push-button control of 10 functions including outlet pressure, input signal (switchable from VDC to mA), pressure scale (psi or bar), minimum pressure, and maximum pressure (within the unit's stated range). All controls are on the same face for easy access. An IP65 enclosure provides indoor protection against dust and dripping liquids. Body is aluminum.

For information about air preparation, see page 963.

Multicontrol Air Regulators

Control multiple regulating pressure ranges from one air supply inlet. Connect your single air supply and set up to eight different outlet pressures (depending on the number of stations you choose). Each station includes a gauge. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Max. temperature is 140° F. Inlet and outlet connections are NPT female.

Compact units are ideal for use in tight spaces. Each unit consists of one manifold base and two, three, four, five, or six regulators. Accuracy is ±1.5%. Made of aluminum. Max. pressure is 120 psi. ***Standard*** units consist of two, four, six, or eight regulators connected modularly. Accuracy is ±3%. Made of zinc. Max. pressure is 232 psi.

Compact 4-Station

Standard 4-Station

No. of Stations	Regulating Range, psi	1/8″ Inlet and Outlet: Max. scfm @ 100 psi	O'all Size, Ht.×Wd.★	Each	1/4″ Inlet, 1/8″ Outlet: Max. scfm @ 100 psi	O'all Size, Ht.×Wd.★	Each

★ Dimensions do not include gauge.

Air-Operated Volume Boosters

Boost a low-flow air control signal up to 50 scfm. The 1:3 and 1:6 ratio models also increase pressure linearly; for example, the 1:3 model would take a low-volume 3 to 15 psi signal and increase it to 9 to 45 psi. All have a high relief function that quickly exhausts up to 15 scfm to protect your components in the event of a system blockage. Body is cast aluminum. Boosters have three air connections: air inlet and outlet connections plus a 1/4″ air control signal connection. All three connections are NPT female. Boosters have two 1/4″ NPT gauge ports (gauge not included).

Pipe Size	Ratio	Max. scfm @ 100 psi	Max. Signal Pressure	Max. Input Pressure	Max. Temp.	Accuracy	O'all Size, Ht.×Wd.	Boosters Each	Mounting Brackets Each

Inline Air Lubricators

Extend the life of your air-powered tools with these lubricators. They automatically lubricate your air tool each time it's used, ensuring smooth operation. All use nondetergent oil (not included).

(A&B) With Easy-View Plastic Bowl— A transparent bowl lets you know when it's time to refill your oil. *Style A* have an aluminum body. Mount directly to the air inlet of your tool. Inlet connection is NPT female. Outlet connection is NPT male. *Style B* has an aluminum and zinc body. Mount within 6 ft. of your device. Inlet and outlet connections are NPT female.

(C) With View Port— A translucent view port in the aluminum reservoir lets you know when it's time to refill your oil. Mount 5- to 6 ft. down the line from your tool. Body is aluminum. Inlet and outlet connections are NPT female.

(D) Solid Body— Mount directly to the air inlet of your tool. Body is aluminum. Inlet connection is NPT female. Outlet connection is NPT male.

♥ Max. temperature is not rated; ambient (surrounding) temperature only.

Air Lubricators

Lubricators release an oil aerosol into the airstream to provide a set amount of internal lubrication to air-operated tools. A self-adjusting flow sensor automatically maintains a constant oil-to-air ratio. Body is aluminum (unless noted). Inlet and outlet connections are NPT female. All use nondetergent oil (not included).

(E) With Aluminum Bowl— All have a sight glass for easy viewing of oil level. Max. temperature is 175° F. Max. pressure is 250 psi.

(F) With Polycarbonate Bowl— Bowl is transparent so you can see oil level. Max. temperature is 125° F. Max. pressure is 150 psi.

● Body is zinc. Includes a metal bowl guard.

For information about air preparation, see page 963.

Space-Saver Stacked Air Filter/Regulators

A&B C D E F

Get a filter and a regulator in one "piggyback" unit the size of a filter alone. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. All include a gauge, except Style F. Inlet and outlet connections are NPT female.

(A&B) Metal Body and Bowl— Have an automatic drain. Filter has a polypropylene element that removes particles as small as 5 microns. Regulator accuracy is ±3 psi.

Style A have a zinc body and bowl. *Style B* have an aluminum body and bowl.

(C&D) Metal Body and Polycarbonate Bowl— A transparent bowl allows you to see what's being filtered. Drain is automatic. Filter has a polypropylene element that removes particles as small as 5 microns. Regulator accuracy is ±3 psi.

Style C have a zinc body. *Style D* have an aluminum body and a steel bowl guard.

(E) Brass Body and Polyurethane Bowl— Offer increased chemical compatibility. A transparent polyurethane bowl won't crack in systems heavy with synthetic compressor oils and allows you to see what's being filtered. Drain is manual. Filter has a polypropylene element and removes particles as small as 5 microns. Regulator accuracy is ±1%.

(F) Stainless Steel Body and Bowl— Ideal for corrosive environments such as those found in the semiconductor, pharmaceutical, marine, chemical, instrumentation, and paper industries, these units are made of Type 316 stainless steel and meet NACE (National Association of Corrosion Engineers) specifications. Drain is manual. Regulator accuracy is ±1%. Filter element is polypropylene. Filter/regulator *with 1/4″ pipe size* removes particles as small as 20 microns. Filter/regulator *with 1/2″ pipe size* removes particles as small as 40 microns.

Space-Saver Stacked Air Filter/Precision Regulator

For precise control in variable conditions, this combination air filter/regulator is the perfect choice. It only takes the space of a filter and is suitable for use in control valves, instrumentation, and other automatic control operations. Has a manual drain and a 1/4″ NPT gauge port (gauge not included). Filter has a cellulose element that removes particles as small as 40 microns. Regulator is relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±0.1-0.2 psi. Max. temperature is 160° F. Max. pressure is 250 psi. Body is cast aluminum and has an epoxy coating for added corrosion resistance. Inlet and outlet connections are NPT female.

To Order: Please specify regulating pressure range (psi): 0-10, 0-30, 0-60, or 0-120.

Pipe Size	Max. scfm @ 100 psi	O'all Size, Ht.×Wd.	Complete Unit	Each	Repl. Filter Element	Each	Mounting Bracket	Each
1/4″	20	7.75″×3.13″	4967K11	$52.20	4967K44	$12.98	4967K33	$8.88

Space-Saver Stacked Oil-Removal Air Filter/Regulators

Units combine an oil-removal (coalescing) air filter and a regulator into a space-saving design. Filters have a polyolefin element that removes 99.9% of particles as small as 0.01 micron. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±5%. All include a flush-mounted gauge and an automatic drain. Units have an aluminum body and polycarbonate bowl, except 4989K101 which has a zinc body and also includes a polycarbonate bowl guard. Max. temperature is 140° F. Max. pressure is 150 psi. Inlet and outlet connections are NPT female. ***Replacement filter element kits*** include filter element, valve assembly, and diaphragm assembly.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	O'all Size, Ht.×Wd.	Complete Units	Each	Repl. Filter Element Kits	Each	Mounting Brackets	Each
1/8″	18	7-120	7.93″×1.57″	4989K101	$87.16	4989K111	$46.38	4989K211	$5.99

3/8″	142	7-120	12.40″×2.76″	4989K301	123.60	4989K131	58.80	4989K231	5.99
1/2″	166	7-120	12.40″×2.76″	4989K401	120.40	4989K131	58.80	4989K231	5.99

Compact Integrated Air Filter/Regulators

Here's a complete air prep system in one compact unit. Units include a filter with element replacement indicator, float-style automatic drain, regulator with gauge, soft-start valve, shut-off valve with padlock and key, and three 1/4″ supplementary air ports (one is for filtered unregulated air and two are for filtered regulated air). Filter has a high-density polyethylene element that removes particles as small as 5 microns. Regulator is relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±2 psi. The adjustable soft-start valve eases pressure into your system, protecting components from the stress of "hard" starts. All controls and replaceable parts are accessible via the unit's front panel to save mounting space (mounting screws included). Units have an IP65 housing for protection against splashing water. Housing is acetal with an aluminum cover. Inlet and outlet connections are NPT female.

Electric units have an indicator signal switch to let you know whether you're above or below (you select which) your set pressure. All operate on 24 VDC power and have a 15-ft. electrical cable.

Pipe Size	Max. scfm @ 100 psi	Regulating Range, psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.	Standard	Each	Electric	Each	Repl. Filter Elements	Each
3/8″	120	0-120	122° F	145 psi	5.7″×7″	8628T1	$288.40	8628T11	$445.63	8628T21	$7.27
1/2″	145	0-120	122° F	145 psi	5.7″×7.7″	8628T2	292.52	8628T12	424.33	8628T21	7.27

Optional Panel Mounting Bracket ..... 8628T22 Each $18.37

For information about air preparation, see page 963.

Air Filter/Regulator/Lubricators (FRLs)

A&B

C

D&E

F

G

H&J

Just connect the ends to your system—we've already selected matching components and assembled them as one unit, threaded together with pipe nipples. Regulators include a gauge and are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±3 psi or better. Lubricators have a sight glass; 10W nondetergent oil (ISO Grade 32) is recommended. Mounting brackets are sold separately (unless noted) and include hardware. Inlet and outlet connections are NPT female. *Stacked* units combine a filter and regulator into one "piggyback" device, with a lubricator at the side.

(A, K, M) Standard—Filters have a polypropylene element that removes particles as small as 5 microns. Drain is automatic. Body and bowl are zinc.

(B, F, L, N) Lightweight—Filters have a polypropylene (unless noted) element that removes particles as small as 5 microns. Drain is automatic. Body and bowl are aluminum.

(C, G) Easy View—A clear polycarbonate bowl lets you see what's being filtered. Filters have a polyethylene element, except stacked units which have a polypropylene element. All remove particles as small as 5 microns. Drain is automatic. Body is zinc.

(D, H) Lightweight Easy View—A clear polycarbonate bowl lets you see what's being filtered, while an aluminum body makes the unit lightweight. Filters have a polypropylene element that removes particles as small as 20 microns (unless noted). Drain is manual (unless noted).

(E, J) Chemical Resistant—Have increased chemical compatibility. A clear polyurethane bowl lets you see what's being filtered and won't crack in systems heavy with synthetic compressor oils. Filters have a polypropylene element that removes particles as small as 20 microns. Drain is manual. Body is brass.

■ Requires two mounting brackets. ♣ Filter element is bronze. ● Mounting bracket is attached.
♦ Filter element removes particles as small as 5 microns. Drain is automatic.

For information about air preparation, see page 963.

Modular Air Filter/Regulator/Lubricator (FRL) Complete Units

These modular filter/regulator/lubricators, also known as FRLs, use a joiner clamp between each component for fast installation and speedy maintenance. Simply identify your clamp and locate a compatible unit. It's easy to connect and disconnect components. Inlet and outlet connections are NPT female.

Stacked Units— Combine a filter and regulator into one "piggyback" device, with a lubricator at the side. ***End Block Kits—*** Allow you to take full advantage of the modular design. Each kit includes one end block for the inlet and one for the outlet; blocks thread onto your pipe.

Complete FRLs with Wilkerson Clamps

Wilkerson Clamp

All include joiner clamps and mounting brackets, except 1″ units which connect using built-in bolts instead of joiner clamps. Body is zinc, except 1″ pipe size units which have a cast aluminum body. Max. temp. is 150° F. Max. pressure is 250 psi.

Filters— A polyethylene element removes particles as small as 5 microns. Drain is automatic. All have a sight glass and a zinc bowl, except 1″ pipe size units which have an aluminum bowl.

Regulators— All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Regulating range is 5-125 psi, except 1″ units which have a 7-125 psi regulating range. Gauge included. Accuracy is ±5%.

Lubricators— Use 10W nondetergent oil. All have a sight glass and a zinc bowl, except 1″ pipe size units which have an aluminum bowl.

Inline

Stacked

Complete FRLs with Norgren Clamps

Norgren Clamp

Unique hinged joiner clamps (included) have no loose parts, so it's even easier to connect and disconnect components. Also include mounting brackets. Body is aluminum and has a black epoxy finish for corrosion resistance. Max. temp. is 125° F. Max. pressure is 150 psi.

Filters— A polypropylene element removes particles as small as 5 microns. Drain is automatic. Bowl is clear polycarbonate and has a steel bowl guard.

Regulators— All are relieving style, reducing downstream pressure through a vent port when your system is blocked. Regulating range is 5-150 psi. Gauge included. Accuracy is ±3 psi.

Lubricators— Use 10W nondetergent oil and have a liquid level indicator. Bowl is clear polycarbonate and has a steel bowl guard (unless noted).

Inline

Stacked

Complete FRLs with Parker Clamps

Parker Clamp

A soft-start lockout valve provides positive shutoff and exhaust capability (max. shackle dia. is 9/32″; padlock not included). Joiner clamps and mounting brackets included. Body is zinc. Max. temp. is 125° F. Max. pressure is 150 psi.

Filters— A polyethylene element removes particles as small as 40 microns. All have a manual drain. Bowl is clear polycarbonate and has a steel bowl guard.

Regulators— All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Regulating range is 5-125 psi. Gauge included. Accuracy is ±3 psi.

Lubricators— All use petroleum-based 100-200 SSU oil. Bowl is clear polycarbonate and has a steel bowl guard.

Inline

Stacked

Complete FRLs with SMC Clamps

SMC Clamp

All include joiner clamps and mounting brackets. Body is aluminum. Max. temp. is 140° F. Max. pressure is 145 psi.

Filters— A nonwoven fabric element removes particles as small as 5 microns. All have a float-style automatic drain. Bowl is clear polycarbonate and has a steel bowl guard.

Regulators— An embedded gauge prevents accidental damage. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Regulating range is 7-120 psi. Accuracy is ±5%.

Lubricators— All use 10W nondetergent oil. Bowl is clear polycarbonate and has a steel bowl guard.

Replacement SMC Joiner Clamp with Mounting Brackets for 3/4″ and 1″ Pipe Size Units										8550T3	Each		$10.67

■ Lubricator has an aluminum bowl guard.

For information about air preparation, see page 963.

Modular Air Filter/Regulator/Lubricator (FRL) Replacement Components

Need to replace a component in your modular air filter/regulator/lubricator? Look no further. All replacement components have NPT female inlet and outlet connections. For information on Wilkerson, Norgren, SMC, and Parker clamp modular filter/regulator/lubricators, see page 978.

Modular Air Filter/Regulator/Lubricator (FRL) Accessories

For information on Wilkerson, Norgren, SMC, and Parker clamp FRLs, see page 978. Inlet and outlet connections are NPT female.

Oil-Removal Filters

Wilkerson *Norgren*

Parker *SMC*

Also known as coalescing filters. Max. pressure is 150 psi (unless noted).

For Wilkerson Clamp— A borosilicate glass fiber element removes particles as small as 0.7 micron. All have an automatic drain and a sight glass. Body and bowl are zinc (unless noted). Max. temperature is 150° F.

For Norgren Clamp— A synthetic fiber and polyurethane foam element removes particles as small as 0.01 micron. Drain is automatic. Body is aluminum. Bowl is polycarbonate and has a steel bowl guard (unless noted). Max. temperature is 125° F.

For Parker Clamp— A borosilicate and felt glass fiber element removes solid particles as small as 0.3 micron and aerosols as small as 0.75 micron. All have a float-style automatic drain. Body is zinc. Bowl is polycarbonate and has a steel bowl guard. Max. temperature is 125° F.

For SMC Clamp— A plastic element removes particles as small as 0.01 micron and aerosols down to 0.008 ppm. All have a float-style automatic drain. Body is aluminum. Bowl is polycarbonate and has a steel bowl guard. Max. temperature is 140° F.

★ Body and bowl are aluminum. Max. pressure is 250 psi.
♥ Does not have a bowl guard. ♦ Max. pressure is 145 psi.

Manifold Regulators

Wilkerson

Norgren

Connect two or more of these regulators with joiner clamps (sold separately) to independently control multiple output pressures from one pressure supply. Buy one regulator for each output pressure you need. Each regulator has at least one regulated port and one unregulated outlet. Body is zinc.

For Wilkerson Clamp— Each regulator has two 1/4″ NPT female regulated ports (one can be used as a gauge port; gauge not included). Accuracy is ±5%. Max. temperature is 150° F. Max. pressure is 300 psi. **To Order:** Please specify regulating pressure range (psi): 0-30, 3-60, 5-125, or 10-250.

For Norgren Clamp— Each regulator has one 1/4″ NPT female regulated port (gauge included). Accuracy is ±3 psi. Max. temperature is 150° F. Max. pressure is 290 psi. **To Order:** Please specify regulating pressure range (psi): 5-60 or 5-150.

Desiccant Air Dryers

With Polycarbonate Bowl *With Aluminum Bowl*

Eliminate moisture at the point of use to deliver clean, dry air directly to your power tools and machinery. Dryers come filled with silica gel desiccant that produces air with a dew point of 15° F below inlet air dew point. To regenerate, remove and heat at 275° F until desiccant returns to blue. Body is aluminum.

Note: Only compatible with Norgren clamp modular filter/regulator/lubricators.

With Polycarbonate Bowl— A clear bowl lets you view desiccant condition. All have a steel guard. Max. temperature is 125° F. Max. pressure is 150 psi.

With Aluminum Bowl— A moisture indicator lets you know when desiccant needs to be regenerated or replaced. Max. temperature is 175° F. Max. pressure is 250 psi.

Replacement Desiccant— Furnished in a 0.25 lb. bag. Polycarbonate-bowl units require one bag of replacement desiccant; aluminum-bowl units require five bags.

OSHA-Compliant Lockout Valves

Wilkerson *Norgren*

Parker *SMC*

Prevent accidental start-up when servicing equipment. Valves exhaust downstream air when closed, and are lockable in the closed position (max. shackle dia. is 5/16″ unless noted; padlock not included). All comply with OSHA's lockout/tagout regulation (29 CFR 1910).

For Wilkerson Clamp— Have bright orange slide lock mechanisms. Body is zinc. Max. temperature is 150° F. Max. pressure is 150 psi.

For Norgren Clamp— Have yellow slide lock mechanisms. Body is zinc. Max. temperature is 150° F. Max. pressure is 250 psi.

For Parker Clamp— Have red slide lock mechanisms. Body is aluminum. Max. temperature is 125° F. Max. pressure is 250 psi.

For SMC Clamp— Have red locking handle. Body is aluminum. Max. temperature is 140° F. Max. pressure is 145 psi.

For information about air preparation, see page 963.

Modular Air Filter/Regulator/Lubricator (FRL) Accessories *(Continued from previous page)*

Oil Vapor- and Odor-Removal Filters

An activated carbon element removes odor and oil vapor as small as 0.003 micron, exceeding ISO Class 1 requirements for max. oil content. Drain is manual. Body and bowl are zinc. Inlet and outlet connections are NPT female. *Note:* Oil vapor- and odor-removal filters are only compatible with Wilkerson clamp modular FRLs but can be pipe-connected to other clamp units.

Pipe Size	Max. scfm @ 100 psi	Max. Temp.	Max. Pressure	O'all Size, Ht.×Wd.	Filters	Each	Repl. Filter Elements	Each	Joiner Clamps	Each

Space-Saver Stacked Air Filter/Regulator/Lubricators (FRLs)

Get a filter, regulator, and lubricator in an easy-to-install unit that takes the space of a filter alone. Filters have a bronze element that removes particles as small as 40 microns. Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±6%. Lubricators use 10-wt. nondetergent oil (ISO Grade 32). All have a semiautomatic drain and include a gauge and built-in mounting brackets. Body and bowl guard are cast aluminum. Bowl is polycarbonate. Max. temperature is 120°F. Max. pressure is 230 psi. Inlet and outlet connections are NPT female.

Regulator service kits include diaphragm assembly, O-rings, valve seat, spring, and stem.

Miniature Modular Air Filter/Regulator/Lubricators (FRLs)

When space is tight, a miniature design provides an efficient solution. Body is zinc. Max. temperature is 125° (unless noted). Max. pressure is 150 psi (unless noted). Inlet and outlet connections are NPT female.

Filters have a polyethylene element that removes particles as small as 5 microns (unless noted). All have a manual drain, polycarbonate bowl with guard, and a sight glass.

Regulators include a damage-resistant flush-mounted gauge, except 4927K11 and K12. All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Regulating range is 5-125 psi (unless noted). Accuracy is ±5%.

Lubricators have a sight glass and a polycarbonate bowl with guard. They use 10W nondetergent oil.

Complete Units

All include joiner clamps and mounting brackets.

Stacked Models— Combine a filter and regulator in one "piggyback" device, with a lubricator at the side.

End Block Kits— Allow you to take full advantage of the modular design. Each kit includes two end blocks (one for the inlet and one for the outlet) that thread onto your pipe.

Filter

Regulator

Lubricator

Oil-Removal Filter

Joiner Clamp

Accessories

Require joiner clamp (sold separately) to connect.

Oil Vapor- and Odor-Removal Filter— An activated carbon element removes odor and oil vapor as small as 0.003 micron, exceeding ISO Class 1 requirements for maximum oil content.

Manifold Regulators— Connect two or more of these together with joiner clamps (sold separately) to independently control multiple outlet pressures from one pressure supply. Buy one regulator for each output pressure you need. Each regulator has two 1/8″ NPT female regulated ports (one can be used for a gauge; not included) and one unregulated outlet. Pipe size refers to the inlet connection and the unregulated outlet connection (for connecting to another regulator). Max. temperature is 150°F. Max. pressure is 300 psi.

To Order: Please specify regulating pressure range (psi): 0-30, 0-60, or 0-125.

Safety Lockout Valves— Prevent accidental start-up when you're servicing equipment. Valves exhaust downstream pressure air when closed and are lockable in the closed position (max. shackle dia. is 5/16″; padlock not included). All have a bright orange slide lock mechanism. Meet OSHA lockout/tagout regulation 29 CFR 1910. Maximum temperature is 150°F.

For information about air preparation, see page 963.

Lightweight Miniature Modular Plastic Air Filter/Regulator/Lubricators (FRLs)

Get all the benefits of an FRL in a lightweight, corrosion-resistant, nonmagnetic unit. All have an aluminum body. Max. temperature is 125° F. Max. pressure is 150 psi. Inlet and outlet connections are NPT female with an aluminum insert.

Filters have a polyethylene element that removes particles as small as 5 microns. All have a manual drain and a polycarbonate bowl with a glass-reinforced nylon bowl guard.

Regulators include a flush-mount gauge. All are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Accuracy is ±8.7%.

Lubricators include a sight glass and have a polycarbonate bowl with a glass-reinforced nylon guard. All use 10W nondetergent oil.

Complete Units

Push-to-Connect Miniature Modular Air Filter/Regulator/Lubricators (FRLs)

Inline

Stacked

Push-to-connect tube fitting connections make installation a snap. Body is cast zinc, except 1/2″ tube OD sizes which have an aluminum body. All include mounting brackets. Max. temperature is 140° F. Max. pressure is 145 psi.

Filters have a plastic element that removes particles as small as 5 microns. All have a manual drain and a polycarbonate bowl.

Regulators have an embedded gauge to prevent accidental damage (unless noted). All are relieving style, which reduces downstream pressure through a vent port if your system is blocked. Accuracy is ±5%.

Lubricators have a polycarbonate bowl. All use VG32 oil (see 3499K on page 2176).

Stacked Models— Combine a filter and regulator in one "piggyback" device, with a lubricator at the side.

Ultra-Compact Modular Air Filter/Regulator/Lubricators (FRLs)

The smallest filter/regulator/lubricator we sell—ideal for laboratory use, instrumentation, and micro machining. Body is cast zinc. Max. temperature is 140° F. Max. pressure is 145 psi.

Filters have a plastic element that removes particles as small as 5 microns. All have a manual drain and a polycarbonate bowl.

Regulators are relieving style, which reduces downstream pressure through a vent port when your system is blocked. Regulating range is 7-100 psi. Gauge is included. Accuracy is ±5%.

Lubricators have a polycarbonate bowl and a sight glass. They use VG32 oil (see 3499K on page 2176).

Air Flow Control Valves

Also known as cylinder speed controls, these valves let you control the extension or retraction speed of your air cylinder. They regulate air flow in the flow-control direction (inlet to outlet) and allow air to free flow in the other direction. Simply use the dial to adjust the air flow rate.

Style A are brass. ***Style B*** are zinc. ***Style C*** are aluminum, unless noted. ***Styles D***, ***F***, and ***G*** are PBT (polybutylene terephthalate) plastic (except for 45045K45-45045K49, which are brass). ***Style E*** are glass-filled nylon and have a swivel tube fitting for mounting flexibility.

Corrosion-Resistant Air Flow Control Valves

Similar to our Air Flow Control Valves on the previous page, except these valves have stainless steel parts to handle your corrosive environments. Maximum pressure is 145 psi.

(1-3) PBT (polybutylene terephthalate) plastic valves have Type 303 stainless steel internal parts. Use the dial to adjust the air flow rate.

(4) Metric all-stainless-steel valves are made entirely of Type 316 stainless steel. Use the adjustment screw to adjust the air flow rate.

High-Pressure Universal-Fit Air Flow Control Valves

A universal thread on the inlet of these unique brass valves allows connection to NPT, NPTF (Dryseal), BSPP, and BSPT threads. The outlet is a push-to-connect tube fitting. Also known as cylinder speed controls, the valves let you control the extension or retraction speed of your air cylinder. They regulate air flow in the flow-control direction (inlet to outlet) and allow air to free flow in the other direction. Fittings are nickel-plated brass. Maximum pressure is 265 psi.

(7) Screw Adjust— Use a screwdriver to turn the screw to adjust the air flow rate.

(8) Knob Adjust— Simply turn the knob to adjust the air flow rate.

For information about coefficient of volume, see page 986.

Soft-Start Air Flow Control Valves

By limiting startup air flow, these valves protect your equipment from damage. After the initial startup, the valves gradually raise your system air flow rate to operating levels.

Also known as cylinder speed controls, these aluminum alloy valves let you control the extension or retraction speed of your air cylinder. They regulate air flow in the flow-control direction (inlet to outlet) and allow air to free flow in the other direction. Simply use the dial to adjust the air flow rate. Maximum pressure is 101 psi.

Tamper-Resistant Air Flow Control Valves

For security as well as safety, an adjustment tool (sold below) is required to change the air flow rate of these valves. Also known as cylinder speed controls, these PBT (polybutylene terephthalate) plastic valves let you control the extension or retraction speed of your air cylinder. They regulate air flow in the flow-control direction (inlet to outlet) and allow air to free flow in the other direction. Simply use the tool to adjust the air flow rate. Max. pressure is 145 psi.

Bidirectional Air Flow Control Valves

Because they regulate air flow in both directions, these valves allow you to control the extension and retraction speed of your air cylinder. They are also known as cylinder speed controls.

All valves are made of aluminum. Maximum pressure is 145 psi.

(C) Single-control valves have one knob to change the air flow equally in both directions. ***(D) Dual-control valves*** have two knobs to independently change the air flow in each direction.

Inlet	Outlet	Coefficient of Volume	Max. scfm @ 100 psi		Each

1/8″ BSPP	1/8″ BSPP	0.18	6.84	8897K12	50.86

♦ Body has a hexagon shape.

Quick-Exhaust Air Valves

Quickly dump exhaust air to speed up the movement of your air cylinders, air presses, and other equipment.

(E-G) Valves without Flow Control

All of these valves exhaust directly to the atmosphere.

(E) Inline Valve— Made of brass and aluminum. Maximum pressure is 125 psi.

(F) Right-Angle Valves— Have an exhaust port that also allows you to route exhaust air to another place in your air system. Made of aluminum, unless noted. Maximum pressure is 125 psi.

(G) Valves with Muffler— The muffler reduces noise made by the air as it exhausts. Valves are made of PBT (polybutylene terephthalate) plastic. Maximum pressure is 145 psi.

★ Made of die cast zinc.
■ For tube OD.

(H&J) Valves with Flow Control

Similar to the valves above, except these have a dial so you can control the exhaust air flow rate. They also have a muffler to reduce noise made by the air as it exhausts.

Also known as cylinder speed controls, air flow control valves let you control the extension or retraction speed of your air cylinder. Maximum pressure is 145 psi.

Style H— Connect to your cylinder. A tube connection allows air to flow freely through the valve into the cylinder; air coming out of the cylinder is flow-controlled by the dial and is routed through the muffler and exhausted to the atmosphere. Valves are PBT (polybutylene terephthalate) plastic.

Style J— Have one port that connects to the exhaust port of a directional control valve—good when you can't access your cylinder directly. Use a screwdriver to control the exhaust air flow to the atmosphere. Made of aluminum and brass.

Single-Pressure-Output (3 Way) Valve Shown Controlling a Single-Acting Spring-Return Cylinder

Valve Position 1

Valve Position 2

National Fluid Power Association (NFPA) Diagram of a Single-Pressure-Output (3 Way) Valve with Three Ports and Two Positions

Choosing the Right Control Valve— Sending air pressure to the right place at the right time and then exhausting that pressure when it's no longer needed is a control valve's job. Here are two of the most common styles of control valves:

Two-Pressure-Output (4 Way) Valves— With two pressure output ports, you can use these valves to control a double-acting cylinder, which requires pressure to extend and retract the cylinder rod.

Single-Pressure-Output (3 Way) Valves— With a single pressure output port, you can use these valves to control a single-acting cylinder, which requires pressure to extend the cylinder rod while an internal spring retracts the cylinder rod.

To Operate Control Valves— Use pedals, knobs, and levers to manually operate your control valves. Use rollers and electric solenoids to operate control valves in your automated systems. Electric solenoids will allow automation with computers and programmable logic controllers (PLCs).

Air Flow and Coefficient of Volume (Cv)— Coefficient of volume is a measurement that indicates how much air flow a control valve can provide to your cylinder or component. The higher the Cv value, the higher the air flow rate. Looking at valves with the same port size, but different Cv values and not sure which one to choose? Select the one with the higher Cv value because low air flow can slow down your entire system.

National Fluid Power Association (NFPA) Diagrams— Found on most air control valves, these diagrams depict air flow and valve action. They're useful for replacing control valves—match the diagram on your valve to the new valve.

For NFPA flow diagrams of our valves, go to mcmaster.com and search for **62475KAC**.

Hand-Operated Miniature Air Control Valves

A *Female Inlet*

B *Male Inlet*

C *Push-to-Connect Inlet*

D *Male Inlet*

E

F

With the touch of a finger, these tiny valves can control your air power. Their low flow rates and size make them perfect for your small air-powered systems. All valves are panel mountable and have a panel mount opening of 1/2″ dia. (mounting hardware included). Operating pressure range is 0-125 psi. Not vacuum rated, unless noted.

Single-pressure-output (3 way) valves exhaust directly to the atmosphere.

Manual-Return Valves— Once moved into a position, valve stays in that position until you move the operator into the other position.

Spring-Return Valves— A spring returns the valve to its original position once you let go of the operator. *Single-pressure-output (3 way) valves* are normally closed.

A&B Black Anodized Aluminum— *Two-pressure-output (4 way) valves* have ports on the side; *single-pressure-output (3 way) valves* have ports on the bottom and side.

C&D Nickel-Plated Brass— Have ports on the bottom and side.

E&F Type 303 Stainless Steel— These valves offer good corrosion resistance. Ports are on the bottom and side. Vacuum rated to 26″ Hg.

For information about control valves, see page 986.

Hand-Operated Double Push-Button Air Control Valves

Push one button to put these valves into the first position; push the other to put valves into the second position. Not vacuum rated.

A ***Cast-Aluminum Manual-Return Valve—*** Once in position, valve stays in that position until you push the other button. Ports are on the side. Valve has two 7/32″ mounting holes.

B ***High-Impact Polycarbonate Spring-Return Valve—*** A spring returns the valve to its closed position once you release the buttons. Valve has barbed fitting ports inside the housing for 3/16″ ID tubing. It can also be used as a pendant-style valve. CSA certified. Meets UL 94V2 for flame resistance. Meets IP65 for protection from water projected from a nozzle and NEMA 4X for corrosion resistance. Valve exhausts directly to the atmosphere.

	Pressure Outputs (Ways)	Positions	Max. scfm @ 100 psi	Coefficient of Volume	Operating Pressure Range, psi	No. of Ports	Port Pipe Size	Overall Size, Lg. × Wd. × Ht.		Each
A	2 (4)	2	56	1	40-120	5	1/4″ NPT Female	3.03″ × 1.78″ × 1.91″	**4558K17**	$67.66
B	2 (4)	3	12	0.21	0-125	3	3/16″ Barbed	3.07″ × 2.49″ × 5.17″	**1191K21**	175.00

Hand-Operated Lever Air Control Valves

Simply move the hand lever to control these valves. All are made of aluminum, unless noted. Ports are on the side and are NPT female. Not vacuum rated.

Manual-Return Valves— Once moved into a position, valve stays in that position until you move the lever into another position.

Spring-Return Valves— A spring returns the valve to its original position once you let go of the lever.

C These miniature valves are great for low-flow applications. Valves do not have an exhaust port; air is exhausted directly to the atmosphere.

D Valves have a 0.34″ mounting slot.

E Valves have two mounting holes for extra support. Mounting hole size is M5 for the valves with a 1/8″ port pipe size; M6 for the valves with a 1/4″ port pipe size.

F Made of ABS plastic with an aluminum base. Valves can be removed from their base for easy maintenance. They have two 7/32″ mounting holes.

Safety Lockout Air Control Valves

To prevent accidental system startups, these valves can be locked in their off position with a padlock (not included, see pages 2932-2943; maximum shackle dia. of 25/64″). A window displays the valve status, so you never have to guess if the system is pressurized. Valves meet OSHA requirement 29 CFR 1910.147 for locking, labeling, and disconnecting air-powered equipment.

All of these valves are made of cast aluminum. They have a rotating knob and are manual return (once moved into a position, valve stays in that position until you rotate the knob into the other position). Ports are on the side and bottom. Ports are NPT female. Not vacuum rated.

For more information about control valves, see page 986.

Hand-Operated Air Control Valves

Choose from low-flow and high-flow control valves with a variety of different operators.

Manual-Return Valves— Once moved into a position, valve stays in that position until you move the operator into another position.

Spring-Return Valves— A spring returns the valve to its original position once you let go of the operator. *Low-flow single-pressure-output (3 way) valves* can be used normally closed or normally open. *High-flow single-pressure-output (3 way) valves* are normally closed.

Low Flow

The choice for your low-flow applications. All valves (except styles C and J) are panel mountable and include panel-mounting hardware.

A-M Ports are on the side and are NPT female. *Two-pressure-output (4 way) valves* are cast aluminum with two 0.193″ mounting holes. Not vacuum rated. *Single-pressure-output (3 way) valves* are cast zinc with two 0.156″ mounting holes. Not vacuum rated (except for styles E, F, K, L, and M, which are vacuum rated to 23″ Hg).

N&P All of these metric-ported valves are made of PBT (polybutylene terephthalate) plastic. Not vacuum rated. *Style N* has ports on the bottom and barbed tube connections. It also has two 3.3 mm mounting holes. *Style P* have ports on the side and push-to-connect tube fittings. They also have two 4.2 mm mounting holes.

● For tube OD.

High Flow

Palm-Button Operator

Lever Operator

To power larger cylinders, these valves offer higher flow rates. All are made of aluminum and have ports on the side. They also have two 0.26″ dia. mounting holes. Ports are NPTF female, unless noted. Vacuum rated to 29″ Hg, unless noted. *Note:* NPTF threads (Dryseal) are compatible with NPT threads.

Valves with palm-button operators are also panel mountable (panel mounting hardware included).

♦ Ports are NPT female. Vacuum rated to 26.5″ Hg.

For more information about control valves, see page 986.

Two-Hand Push-Button Safety Air Control Valves

Requiring both hands to operate, these valves protect workers from accidental machinery start-ups. They're great for use on air-powered presses and drills. All are spring-return style (a spring returns the valve to its original position once you release the operator). Ports are on the side. Not rated for vacuum.

Single-pressure-output (3 way) valves are normally closed.

A Nylon—Made of glass-filled nylon. To actuate, valve requires 17 oz. of force.

B Steel—Valves are zinc-plated steel and exhaust directly to the atmosphere. To actuate, 62115K21 and *K23* require 18 oz. of force; 62115K22 and *K24* require 6 oz. of force.

C Steel with Remote Push Buttons—The push buttons (located on the signal valves) are separate, allowing you to position them away from the logic board and your machinery. Valves are aluminum and exhaust directly to the atmosphere. A complete unit consists of two signal valves and one logic unit.

♣ Complete unit, consisting of two signal valves and a logic unit. Signal valve port size is ⅛″ NPT female.

Key-Operated Air Control Valves

Not just anyone can operate these valves. They key lock in position, letting you limit their use to select personnel. Made of aluminum, all are manual return (once moved into a position, valve stays in that position until you lock them into another position). They have ports on the side, two mounting holes, and NPT female ports (unless noted).

Models 8444K34*, K32, K33,* and *K31* include two keys. They are also panel mountable (panel mounting hardware included). *All other valves* include one key.

D Key Operated—Require a key for both positions.

E Button with Key Release—Have a push button that locks and requires a key to be released.

▲BSPP (British Standard Pipe Parallel) female threads. ♥ Has four mounting holes.

Foot-Pedal-Operated Air Control Valves

Using your foot to operate these valves leaves hands free to perform other tasks.

Manual-Return Valves—Once moved into a position, valve stays in that position until you press the foot pedal again. ***Spring-Return Valves***—A spring returns the valve to its original position once you release the foot pedal. ***Foot Guards***—Prevent accidental valve operation. Sold separately for Styles G-J; included with Styles K and L.

F&G Ports are on the side and top. They are also NPTF female. Valves have four mounting holes (0.34″ dia. on 6654K21, K11, and K12; 0.41″ dia. on K23 and K13). Vacuum rated to 29″ Hg. *Note:* NPTF threads (Dryseal) are compatible with NPT threads.

Style F—Manual-return valves.

Style G—Spring-return valves.

H-L All are spring-return valves (except for Style K, which is manual return). Ports are on the back. Valves have a nonskid base to prevent sliding. Not vacuum rated.

Style H—Exhaust directly to the atmosphere. Ports are NPT female.

Style J—Each unit has two valves with two foot pedals to control them. A divider between the pedals prevents the two valves from being operated at the same time. They exhaust directly to the atmosphere. Ports are NPT female.

Styles K and *L*— Ports are BSPP (British Standard Pipe Parallel).

For more information about control valves, see page 986.

Mechanically Operated Air Control Valves

These valves are actuated when an object (such as a box rolling on a conveyor) pushes against the valve operator. All are spring-return style (a spring returns the valve to its original position once the operator is released). Ports are on the side and are NPT female, unless noted.

Single-pressure-output (3 way) valves are normally closed.

Valves with one-direction roller lever are actuated by an object in one direction only.

A-P Low-Flow Valves— Require very low actuation force, making them perfect for small air-powered systems. All have two mounting holes (0.193″ dia. for *A-D*; 5⁄32″ dia. for *E-M*, unless noted; 0.21″ dia. for *N* and *P*). *Styles D, H, L,* and *M* are also panel mountable (hardware included); panel mount size is 15⁄32″ dia.

Styles A-D, N, and ***P*** are aluminum. Not vacuum rated (except for Style N, which is vacuum rated to 28.5″ Hg). ***Styles E-M*** are cast zinc and vacuum rated to 29.9″ Hg, unless noted.

Q-S High-Flow Valves— The choice for applications that require high flow rates and have large forces to actuate the valves. All are made of aluminum and have two 0.26″ dia. mounting holes.

Styles Q and ***R*** have NPTF female inlet and outlet connections. Vacuum rated to 29″ Hg. *Note:* NPTF threads (Dryseal) are compatible with NPT threads.

Style S is vacuum rated to 26.5″ Hg.

★ For tube ID (barbed connection). ♦ PBT (polybutylene terephthalate) plastic; 0.129″ dia. mount. holes; ports on the bottom; not vacuum rated.
● Connections are BSPP (British Standard Pipe Parallel).

Air-Operated Air Control Valves

Perfect for hazardous environments where electrical use can be dangerous, these valves allow automation without electricity. Simply apply compressed air to the control (pilot) port to actuate. Valves are aluminum (except for 6124K76 and K79, which are zinc). Vacuum rated to 26″ Hg (except for 6124K32, K35, K42, and K45, which are rated to 10″ Hg).

Single-Air Control Valves— Valve moves into position when compressed air is supplied; once the air supply is turned off, valve returns to original position via an internal spring. *Single-pressure-output (3 way) models* are normally closed.

Two-Air Control Valves— Valve moves into position when compressed air is supplied to first air control (pilot) port and returns to original position when compressed air is supplied to second air control (pilot) port.

Solenoid Air Control Valves with Built-In Ports

With ports built directly into the body, these valves are very easy to operate—just add compressed air to the input and apply voltage to the electrical connection. All of these solenoid-operated control valves allow remote-controlled or automated processes with high cycle usage. They have two mounting holes (except for 6124K511-K518, which have three and Style C, which have four). Ports are female.

Valves with DIN connectors (Styles A, B, and D) enclose your electrical connections and provide a secure power hookup.

Single-pressure-output (3 way) valves with 2 ports exhaust directly to the atmosphere.

Single-Solenoid Valves— Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring. *The single-pressure-output (3 way) models* are normally closed (except for 61245K2 and 4916K7, which are normally open or normally closed).

Double-Solenoid Valves— Valve moves into position when electrical current is supplied to the first solenoid and returns to original position when current is supplied to the second solenoid.

A *Single Solenoid*

B *Double Solenoid*

C *Double Solenoid*

D

E

F

A The 10-32 valves are made of zinc; all others are aluminum. Power draw for DC valves: 1 watt for 10-32 valves; 2 watts for 1/8″, 1/4″, and 1/2″ valves; 6 watts for 3/8″ valves. Power draw for AC valves: 1.3 volt-amps for 10-32, 1/8″, and 1/4″ valves; 7 watts for 3/8″ valves; 3.5 watts for 1/2″. All valves have a DIN connector with 0.32″ opening. Not vacuum rated. 10-32 valves are available with the coil pins facing up (to be individually wired) or down (for use with a manifold). **To Order:** For all valves, please specify 12 VDC, 24 VDC, or 110/120 VAC. For 10-32 valves, also specify pins up or down.

B These valves have a faster response time than the Style A valves. They're aluminum and have a DIN connector with 1/2″ opening. Power draw is 6.5 watts for DC valves; 8.5 volt-amps for AC valves. Not vacuum rated. **To Order:** Please specify 12 VDC, 24 VDC, 120 VAC, or 240 VAC.

C These valves handle higher flows and larger pipe sizes than the other styles. Made of aluminum. Power draw is 1.8 watts for DC valves; 2.3 volt-amps for AC valves. All have a 1/2″ conduit terminal for electrical connections. Not vacuum rated. **To Order:** Please specify 24 VDC or 110/120 VAC.

D Also known as direct-acting solenoid valves. Made of aluminum. Power draw is 4 watts for DC valves; 5 volt-amps for AC valves. All have a DIN connector with 0.14″ opening. Vacuum rated to 29.8″ Hg. **To Order:** Please specify 12 VDC, 24 VDC, 110/120 VAC, or 240 VAC.

E Valves have two lead wires for electrical connection. Made of aluminum. Power draw is 7 watts for DC valves; 12 volt-amps for AC valves. Not vacuum rated. **To Order:** Please specify 12 VDC, 24 VDC, 120 VAC, or 240 VAC.

F Lugs offer quick and easy electrical connection. They require the crimp-on spade lug connectors (sold separately) to adapt 26- to 22-ga. wire for hookup. Valves are nickel-plated brass and zinc-plated steel. They draw 0.67 watts of power. Vacuum rated to 28″ Hg. **To Order:** Please specify 6, 12, or 24 VDC.

Crimp-On Spade Lug Connectors for Style F—(10/Pkg.) ..... 4916K81 **Per Pkg.** $3.63

✓ NPTF threads (Dryseal) are compatible with NPT threads. ♥ Operating pressure range is 15-150 psi. ♣ Operating pressure range is 22-145 psi. ▲ Operating pressure range is 10-120 psi. ■ Outlet is 1/8″ NPTF; inlet and exhaust are 10-32 UNF.

Push-to-Connect Manifold-Mount Solenoid Air Control Valves

For greater flexibility, you can mix and match the valve styles and sizes you mount on each manifold sold below. When mounting to a manifold, you can use a single pressure source for multiple valves. Ports have push-to-connect tube fittings. Not vacuum rated.

Valves— Must be mounted to a manifold. All are made of plastic and die cast zinc. They are rated at 24 VDC. Power draw is 0.55 watts for 4 mm valves; 0.40 watts for 6 mm valves.

Single-Solenoid Valves—Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring.

Double-Solenoid Valves—Valve moves into position when electrical current is supplied to first solenoid and returns to original position when current is supplied to second solenoid. *The 3-position models* also have a spring that returns the valves to center position.

Manifolds— Mount up to four valves in a single unit. Valves mounted to a manifold share a common input pressure source and exhaust connection. These manifolds are made of plastic and have a 35 mm DIN rail. Inlet and outlet connections are for 8 mm OD.

For more information about control valves, see page 986.

Low-Flow Manifold-Mount Solenoid Air Control Valves

4-Station Manifold with 4 Valves

The choice for low-flow applications, these thermoplastic valves have push-to-connect tube fittings. When mounting them to a manifold, you can use a single pressure source for multiple valves.

Valves— Must be mounted to a manifold. These single-solenoid valves move into position when electrical current is supplied; once current is turned off, they return to original position via an internal spring. DC power draw is 1.3 watts; AC power draw is 1.5 watts. All have quick-connect electrical connections. **To Order:** Please specify 12 or 24 VDC; 24 or 120 VAC.

Two-pressure-output (4 way) valves are not vacuum rated. *Single-pressure-output (3 way) valves* are normally closed and vacuum rated to 28″ Hg.

Manifolds— Use to mount multiple valves in a single unit. Valves mounted to a manifold share a common input pressure source and exhaust connection. The two-pressure-output (4 way) and single-pressure-output (3 way) valves cannot be mounted to the same manifold. All manifolds have push-to-connect tube fittings. They may be mounted on DIN rail (see 8961K on page 915). **To Order:** Please specify number of stations: 2, 3, 4, or 5.

♥ Max. scfm @ 30 psi.

Base/Manifold-Mount Solenoid Air Control Valves

Offering lower power consumption than other valves with similar flow rates, these electrically operated valves mount to a base or manifold so you can use a single pressure source for multiple valves. Same-style valves fit on the same manifold. For example, you can put a 2-position, single-solenoid Style (A) valve and a 3-position, double-solenoid Style (A) valve on the same manifold. Ports are NPT female, unless noted.

Valves— Must be mounted to a single-station base or a manifold.

Single-Solenoid Valves—Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring.

Double-Solenoid Valves—2-position valves move into position when electrical current is supplied to first solenoid and return to original position when current is supplied to second solenoid. 3-position valves have a spring that returns the valves to center position.

A-C Valves have an aluminum body and electrical connections with wire leads (connect power to each valve individually). Power draw is 0.4 watts for DC valves; 1.7 volt-amps for AC valves. Not vacuum rated. **To Order:** Please specify 24 VDC or 110 VAC.

D Also known as a direct-acting valve, this valve responds to electrical signals faster than other solenoid valves. It has an aluminum body and DIN connector with 0.26″ dia. cable opening. The DIN connector encloses your electrical connections and provides a safe power hookup. Power draw is 4 watts for DC valves; 5 volt-amps for AC valves. Connections are 1/8″ NPTF. Vacuum rated to 29.88″ Hg. **To Order:** Please specify 12 or 24 VDC; 110 or 220 VAC.

E These highly corrosion-resistant valves and manifolds meet IP65 and IP67 for resistance to washdowns and splashing water. Valves have chemical-resistant plastic polymer bodies and are 24 VDC. A single cord with lead wires in the manifold powers all mounted valves. Valves draw 1.5 watts of power. Connections are BSPP (British Standard Pipe Parallel) female. Not vacuum rated.

Single-Station Bases— Use to mount a single valve. Made of aluminum.

Manifolds— Use to mount multiple valves in a single unit. Valves mounted to a manifold share a common input pressure source and exhaust connection. All are aluminum (except Style E, which is anodized aluminum). **To Order:** Please specify number of stations (from 2 to 10), unless noted.

For more information about control valves, see page 986.

ISO Base/Manifold-Mount Solenoid Air Control Valves

Designed to meet mounting configurations and flow characteristics of the ISO standard. The ISO size Mini valves meet ISO 15407-1; ISO size 1 and 2 valves meet ISO 5599/1. They must be mounted to a single-station base or a manifold. When mounting to a manifold, you can use a single pressure source for multiple valves. Each valve of the same ISO size fits the same manifold. For example, you can put an ISO size 1, 2-position, single-solenoid valve and an ISO size 1, 3-position, double-solenoid valve on the same manifold. ISO size Mini valve is made of aluminum; ISO size 1 and 2 valves are made of polyamide. Ports are NPT female, unless noted. Not vacuum rated.

Valves— Have an Industrial Standard connection with a 15 mm coil for ISO size Mini valve and a 22 mm coil for ISO size 1 and 2 valves. They also have an opening for cable. **To Order:** For valves, please specify 24 VDC or 110 VAC. Note: DC valves draw 2 watts of power for ISO size Mini; 5 watts for ISO sizes 1 and 2. AC valves draw 2 volt-amps of power for ISO size Mini; 8 volt-amps for ISO sizes 1 and 2.

Single-Solenoid Valves— Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring. Operating pressure range is 45-150 psi (except for 4990K13, which is 29-145 psi).

Double-Solenoid Valves— Valve moves into position when electrical current is supplied to first solenoid and returns to original position when current is supplied to second solenoid. Operating pressure range is 22-145 psi (except for 4990K36 and K38, which is 43.5-145 psi).

Single-Station Bases— Use to mount a single valve. ***Manifolds—*** Mount multiple valves in a single unit. Valves mounted to a manifold share a common input pressure source and exhaust connection. **To Order:** Please specify 2, 3, or 4 stations.

★ Outlet port. ● Connections are BSPP (British Standard Pipe Parallel) female.

Easy-Connect Manifold-Mount Solenoid Air Control Valves

Adding valves couldn't be easier—electrical and plumbing connections are made directly to the manifold, which automatically recognizes the valves as they are connected. When mounting to a manifold, you can use a single pressure source for multiple valves. All valves and manifolds are made of die cast aluminum. Ports have push-to-connect tube fittings. Not vacuum rated.

Valves— Must be mounted to a manifold. Power draw is 0.65 watts. **To Order:** Please specify 12 or 24 VDC for Style A. Style B is 24 VDC.

Single-Solenoid Valves— Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring. Operating pressure range is 22-101 psi.

Double-Solenoid Valves— Valve moves into position when electrical current is supplied to first solenoid and returns to original position when current is supplied to second solenoid. Operating pressure range is 14-101 psi for 2-position models; 29-101 psi for 3-position models. *The 3-position models* also have a spring that returns the valves to center position.

Manifolds— Mount 2 valves, but can be expanded to mount up to 20 valves when you use the optional expanders (sold below). Valves mounted to a manifold share a common input pressure source and exhaust connection. Manifolds have a 35 mm DIN rail.

Manifold Extender for Style A—**To Order:** *Please specify for use with single- or double-solenoid valves.* ..... 6242K55 Each $35.44
Manifold Extender for Style B—**To Order:** *Please specify for use with single- or double-solenoid valves.* ..... 6242K56 Each $35.05
26-Pin Circular-Connection Cable—*16.4 feet long.* ..... 6242K505 Each $116.45

♣Manifolds are IP67 rated for temporary water submersion.

High-Flow Solenoid Air Control Valves

You'll get high flow capacities in a compact design with these electrically operated valves. All mount to a manifold so you can use a single pressure source for multiple valves. Same-style valves fit on the same manifold. For example, you can put a 2-position, single-solenoid Style C valve and a 3-position, double-solenoid Style C valve on the same manifold. Ports are NPTF (Dryseal) female.

Valves— These valves can be mounted to a manifold as well as used by themselves in line. All are die cast aluminum. Operating pressure range is 14.5-150 psi. Power draw is 3.5 watts for DC valves; 4 watts for AC valves. Vacuum rated to 28″ Hg. **To Order:** Please specify 24 VDC or 120 VAC.

Single-Solenoid Valves— Valve moves into position when electrical current is supplied; once current is turned off, valve returns to original position via an internal spring.

Double-Solenoid Valves— Valve moves into position when electrical current is supplied to first solenoid and returns to original position when current is supplied to second solenoid. *The 3-position models* also have a spring that returns the valves to center position.

Style C— Max. scfm @ 100 psi is 56. Coefficient of volume is 1. ***Style D—*** Max. scfm @ 100 psi is 95.2. Coefficient of volume is 1.7.

Manifolds— Use to mount multiple valves in a single unit. Valves mounted to a manifold share a common input pressure source and exhaust connection. All manifolds are die cast aluminum. **To Order:** Please specify number of stations: 2 to 12.

Stainless Steel Air Cylinders

When used with compressed air, these air cylinders provide linear force to automate your systems. All are nonrepairable, which means you simply replace them when necessary.

For good corrosion resistance, these cylinders have a Type 304 stainless steel barrel, Type 303 stainless steel rod, aluminum end caps, and a zinc-plated carbon steel mounting nut. All except the 7/16″ bore single-acting cylinders also have a sintered-bronze rod bushing. Cylinders are not switch ready. Force listed is rated at 100 psi. Maximum pressure is 250 psi. Temperature range is 32° to 200° F. Ports are female.

Single-acting cylinders with spring return have one compressed air port to extend in the "push" direction; an internal spring retracts in the "pull" direction.

Double-acting cylinders have two compressed air ports; one to extend in the "push" direction and another to retract in the "pull" direction.

Single-Acting Cylinder with Spring Return (Force in Push Direction)

Double-Acting Cylinder (Force in Push and Pull Direction)

Switch-Ready Stainless Steel Air Cylinders

Reed Switch Shown Installed on Cylinder

Switch-ready cylinders make it a cinch to add an optional switch (sold separately below) to actuate relays, solenoids, controllers, and more. All of these cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are nonrepairable, which means you simply replace them when necessary.

Cylinders have a Type 304 stainless steel barrel; Type 303 stainless steel rod; oil-impregnated, sintered-bronze rod bushing; and aluminum end caps. They can be nose or pivot mounted. Mounting nut not included. Maximum pressure is 250 psi. Temperature range is –20° to +200° F.

To Order: Please specify stroke length in 1″ increments from the ranges listed.

Cushioned and Washdown Stainless Steel Air Cylinders

All of these cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. The cylinders are nonrepairable, which means you simply replace them when necessary. They can be nose or pivot mounted, unless noted. They are not switch ready. Maximum pressure is 250 psi. Temperature range is –20° to +200° F.

Cylinders with Cushion

To avoid slamming and decrease noise, these cylinders have an air cushion that decelerates the rod in the "pull" direction. They have a Type 304 stainless steel barrel; Type 303 stainless steel rod; oil-impregnated, sintered-bronze rod and pivot bushings; aluminum end caps; and a zinc-plated steel mounting nut (except for 2″, 2 1/2″ and 3″ bore sizes, which do not include a mounting nut). *Note:* The 1 1/2″ bore sizes can not be pivot mounted. **To Order:** Please specify stroke length in 1″ increments from the ranges listed.

Cushioned and Washdown Stainless Steel Air Cylinders *(Continued from previous page)*

Washdown Cylinders

Able to withstand wet as well as chemical environments, these cylinders are fully corrosion resistant. They have a Type 304 stainless steel barrel, Type 303 stainless steel rod and end caps, urethane rod wiper to keep contaminants out of the cylinder, and PTFE rod and pivot bushings. Mounting nut not included. **To Order:** Please specify stroke length in 1/2″ increments from the ranges listed.

Rod Clevis with Pin

Foot Bracket

Pivot Bracket with Pin

Repairable Air Cylinders

To extend the service life of these cylinders, simply repair them by using the replacement seal kits. All cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction.

Compact Brass Cylinders

The choice for tight spaces, these compact cylinders are also nonmagnetic. They have a brass barrel and end caps, Type 303 stainless steel rod, and sintered-bronze rod bushing. Cylinders can be nose or pivot mounted (mounting nuts included). They are not switch ready. Maximum pressure is 250 psi. Temperature range is 30° to 230°F. **To Order:** For cylinders, please specify stroke length in 1″ increments from the ranges listed.

Rod clevis is brass with a zinc-plated steel pin. ***Foot brackets*** are zinc-plated steel.

Switch-Ready Aluminum Cylinders

Extra-thick walls and a unique piston seal make these switch-ready cylinders extremely durable. All have an anodized aluminum alloy barrel and end caps, chrome-plated steel rod, and sintered-lead bronze rod bushing. Two holes on the barrel and four holes on the face allow mounting. Maximum pressure is 140 psi. Temperature range is 40° to 140°F. **To Order:** Please specify stroke length in 1/2″ increments from the ranges listed.

Aluminum Tie Rod Air Cylinders

3/4″ and 1 1/8″ Bore Sizes

1 1/4″ to 4 1/2″ Bore Sizes

External tie rods, which are made of steel, protect the cylinder barrel while still allowing easy disassembly for repairs. To make repairs, use the replacement seal kits. All of these cylinders are an economical choice for high-force output when the cylinder is working against simple horizontal loads, with no side loading. They are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are not interchangeable with NFPA-footprint cylinders. Maximum pressure is 250 psi (except for 3/4″ and 1 1/8″ bore sizes, which is 150 psi). Temperature range is 10° to 200° F (except for 3/4″ and 1 1/8″ bore sizes, which is 0° to 180° F). **To Order:** For all cylinders, please specify stroke length in 1/2″ increments from the ranges listed.

Cylinders and ***Cylinders with Cushion***—Have an aluminum barrel, rod bearing, and end caps; chrome-plated steel piston rod. They are not switch ready.

Switch-Ready Cylinders—Have an aluminum barrel. For *3/4″ and 1 1/8″ bore sizes:* rod bearing is bronze, piston rod is Type 303 stainless steel, and end caps are steel. For *all other sizes:* rod bearing and end caps are aluminum; piston rod is chrome-plated steel.

Sure-Fit Switch-Ready Tie Rod Air Cylinders

"Sure-fit" means these cylinders have NFPA (National Fluid Power Association) industry-standard mounting footprints, ensuring easy interchangeability. All are switch ready and have external tie rods to protect the cylinder barrel while still allowing easy disassembly for repairs. To make repairs, use the replacement seal kits. Engineered to handle high-force applications, these cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction.

Maximum pressure is 250 psi. Temperature range is –20° to +200° F.

To Order: For all cylinders, please specify stroke length in 1/2" increments from the ranges listed.

For additional information about these products, go to mcmaster.com and search for **6211KAC**.

Extended-Life Aluminum Cylinders with Cushion

Just like the Aluminum Cylinders above, except these have a specially designed rod bearing that's made of graphite-filled cast iron and coated with PTFE to improve cylinder life by 25%. These cylinders also have an air cushion, which decelerates the rod in the "pull" direction to avoid slamming and decrease noise.

Stainless Steel Washdown Cylinders with Cushion

Able to withstand wet as well as chemical environments, these cylinders are corrosion resistant. All have a Type 304 stainless steel barrel. Piston is aluminum; piston rod is Type 303 stainless steel with PTFE rod wiper. Rod bearing with PTFE wear ring, end caps, and tie rods are Type 303 stainless steel. These cylinders also have air cushions, which decelerate the rod in the "pull" direction to avoid slamming and decrease noise. No mounting holes (E) as illustrated.

Nonrotating Sure-Fit Switch-Ready Tie Rod Air Cylinders

Shown with Switch (Sold Separately)

No need for an external guide—two parallel piston rods reduce twisting and turning through the stroke of the cylinder. An excellent choice for high side-load applications.

"Sure-fit" means these cylinders have NFPA (National Fluid Power Association) industry-standard mounting footprints, ensuring easy interchangeability. All are switch ready. External tie rods, which are made of steel, protect the cylinder barrel while still allowing easy disassembly for repairs. To make repairs, use the replacement seal kits. Cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They also have an air cushion (except for 1⅛″ bore size), which decelerates the rod in the "pull" direction to avoid slamming and decrease noise.

Cylinder barrel and end caps are aluminum. Piston rods are chrome-plated steel with PTFE-coated cast iron rod bearings. Maximum pressure is 250 psi (except for 1⅛″ bore size, which is 150 psi). Temperature range is –20° to +200° F.

To Order: For cylinders, please specify stroke length in 1″ increments from the ranges listed.

Also Available: Heavy duty cylinders with three parallel piston rods for even greater twisting and turning protection. Please ask for 6662K1 for 1½″ bore size; 6662K2 for 2″ bore size; 6662K3 for 2½″ bore size and specify stroke length (2″-36″ in 1″ increments). *Note:* The maximum stroke length for horizontal applications is 10″ for 1½″ bore size, 14″ for 2″ bore size, and 20″ for 2½″ bore size.

ⓘ For additional information about these products, go to mcmaster.com and search for **6648KAC**.

Extruded-Aluminum Sure-Fit Switch-Ready Tie Rod Air Cylinders

Shown with Switch (Sold Separately)

Rod Clevis

Clevis Bracket

Pivot Bracket

The extruded-aluminum body prevents dirt and debris from getting trapped between the tie rods and cylinder body. The integral tie rods protect the cylinder barrel while still allowing easy disassembly for repairs. To make repairs, use the replacement seal kits.

"Sure-fit" means these cylinders have NFPA (National Fluid Power Association) industry-standard mounting footprints, ensuring easy interchangeability. All are switch ready. Cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They also have an air cushion, which decelerates the rod in the "pull" direction to avoid slamming and decrease noise.

Cylinder barrel and end caps are anodized aluminum. Piston rod is chrome-plated steel and has a corrosion-resistant graphite bearing that can withstand side loads. Maximum pressure is 200 psi. Temperature range is 0° to 160° F. ***Attachments*** are aluminum.

To Order: For cylinders, please specify stroke length in 1″ increments from the ranges listed.

ISO-Metric Extruded-Aluminum Switch-Ready Tie Rod Air Cylinders

Similar to Extruded-Aluminum Air Cylinders on the previous page, except these have ISO (International Standards Organization) mounting footprints for easy interchangeability and meet ISO 6431 and VDMA (German Engineering Federation) 24562 standards. All are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They also have an air cushion, which decelerates the rod in the "pull" direction to avoid slamming and decrease noise. Cylinders are repairable, simply use replacement seal kits.

Cylinder barrel and end caps are cast aluminum; piston rod is Type 400 series stainless steel. Maximum pressure is 145 psi. Temperature range is 14° to 176° F.

Attachments—*Rod clevis* is steel; *brackets* are aluminum.

To Order: For cylinders, please specify stroke length in 25 mm increments from the ranges listed.

Pancake Tie Rod Air Cylinders

You'll get the power and stroke of other tie rod cylinders with similar stroke lengths in less than half the space. All of these cylinders are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Cylinders are repairable, simply use the replacement seal kits. They also have holes for flush bottom mounting. Maximum pressure is 200 psi.

★ Only one switch can be used with the 1/4″ stroke length.

Nonrotating Pancake Aluminum Tie Rod Air Cylinders

No need for an external guide—two parallel piston rods reduce twisting and turning through the stroke of the cylinder. These compact cylinders provide the power and stroke of other tie rod cylinders with similar stroke lengths in less than half the space. They are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Cylinders are repairable, simply use the replacement seal kits. They also have holes for flush bottom mounting.

Cylinders have a Type 304 stainless steel barrel for excellent corrosion resistance; anodized aluminum tie rods and end caps; Type 303 stainless steel rod; and oil-impregnated bronze bearing. Maximum pressure is 200 psi. Temperature range is 0° to 150° F. **To Order:** For cylinders, please specify stroke length in 1/4" increments from the ranges listed.

Square Pancake Aluminum Tie Rod Air Cylinders

The square shape allows face as well as flush-bottom mounting. It also allows side-by-side mounting with less centerline distance than round cylinders. All of these compact cylinders provide the power and stroke of other tie rod cylinders with similar stroke lengths in less than half the space. They are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Cylinders are repairable, simply use the replacement seal kits.

Cylinders have a Type 304 stainless steel barrel for excellent corrosion resistance; anodized aluminum end caps; Type 303 stainless steel rod and tie rods; and oil-impregnated bronze bearing. Maximum pressure is 200 psi for 3/4"-2" bore sizes and 150 psi for 2 1/2"-4" bore sizes. Temperature range is 0° to 150° F.

To Order: For cylinders, please specify stroke length in 1/4" increments from the ranges listed.

★ Only one switch can be used with the 1/4" stroke length.

Super-Flat Pancake Aluminum Air Cylinders

Just as the name implies, these are the flattest cylinders we offer. All provide the power and stroke of other tie rod cylinders with similar stroke lengths in less than half the space. They are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Cylinders are repairable, simply use the replacement seal kits. They are not switch ready. Cylinders have an aluminum barrel, chrome-plated steel rod, and oil-impregnated bronze bearing. They also have holes for flush-bottom mounting (two holes for 3/4"-2" bore sizes; four for 2 1/2"-4" bore sizes). Maximum pressure is 150 psi. Temperature range is –40° to +250° F. **To Order:** For cylinders, please specify stroke length in 1/8" increments from the ranges listed.

Compact Extruded-Aluminum Switch-Ready Air Cylinders

With 1/2" to 1" Bore

With 1 1/4" to 4" Bore

With 1 1/4" to 4" Bore

Perfect for tight spots, these cylinders have an extruded-aluminum body. All are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are repairable, simply use the replacement seal kits.

Standard cylinders have a Type 304 stainless steel rod for 1/2"-1" bore sizes and a chrome-plated steel rod for 1 1/4"-4" bore sizes. Maximum pressure is 145 psi. Temperature range is 15° to 140° F.

Nonrotating cylinders reduce twisting and turning throughout the stroke of the cylinder. Rod is Type 303 stainless steel. Maximum pressure is 150 psi. Temperature range is –25° to +250° F.

To Order: For cylinders, please specify stroke length in 1/16" increments from the ranges listed.

Subminiature Stainless Steel Air Cylinders

Sized just right for your tightest spaces, these extra-tiny cylinders provide linear force to automate your systems. Both are single acting with a spring return—they have one compressed air port to extend in the "push" direction; an internal spring retracts in the "pull" direction.

Cylinders have a Type 303 stainless steel barrel, piston rod, and end caps; Type 302 stainless steel internal spring. Mounting thread is on the rear of the cylinder for easy installation. Piston rod is unthreaded.

These cylinders are not repairable, which means you simply replace them when necessary. They are not switch ready. Maximum pressure is 150 psi. Temperature range is 30° to 180° F.

For additional information about these products, go to mcmaster.com and search for **7725KAC**.

Miniature Brass Air Cylinders

These small, nose-mount cylinders include a jam nut so you can mount them in a minimal amount of space. All are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Cylinders are repairable, simply use the replacement seal kits.

Cylinders have a nickel-plated brass barrel and jam nuts; Type 304 stainless steel piston rod. Maximum pressure is 100 psi. Temperature range is 40° to 140° F.

To Order: For cylinders, please specify stroke length: 1/4", 3/8", 1/2", 3/4", 1", or 1 1/4" (unless noted).

For additional information about these products, go to mcmaster.com and search for **59155KAC**.

Easy-Mount Miniature Brass Air Cylinders

Single Acting with Spring Return

No need for special mounting attachments. Simply drill a hole to accommodate the body thread size, insert cylinder, and secure it in place with jam nuts; or tap a hole to accommodate the body thread size and lock cylinder in place with a jam nut. All cylinders include two jam nuts except 6604K25, which includes one. Great for use in extremely close spaces.

Cylinders have a nickel-plated brass body, Type 303 stainless steel piston rod, bronze rod bushing, and steel jam nuts. They are not repairable, which means you simply replace them when necessary. They are not switch ready. Maximum pressure is 125 psi. Temperature range is 0° to 220° F.

Single-acting cylinders with spring return have one compressed air port to extend in the "push" direction; an internal spring retracts in the "pull" direction. The internal spring is made of steel.

Double-acting cylinders have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. In addition to the 10-32 port in the rear, these cylinders have a 6-32 barbed side port, which accepts 1/16" ID hose. For additional tube fittings, see pages 156-165.

Short-Stroke Air-Clamping Cylinders

Nonadjustable Stroke Vertical Mount

Adjustable Stroke Vertical Mount

Vertical Mount

Also known as air clamps, these cylinders are great for applying clamping pressure in one direction over short stroke lengths. All are single acting with a spring return—they have one compressed air port to extend in the "push" direction; an internal spring retracts in the "pull" direction. Cylinders are not repairable, which means you simply replace them when necessary. They are not switch ready.

Body is aluminum. Piston rod is steel and unthreaded. Port pipe size is 1/8" NPT female. Maximum pressure is 150 psi. Temperature range is –40° to +250° F.

Cylinders with Adjustable Stroke Length— You can adjust the stroke length within the range listed.

Horizontal Mount

Bore Size	Stroke Length	Force @ 100 psi, lbs.	Spring Force, lbs.	*Vertical Mount* Retracted Length (A)		Each	*Horizontal Mount* Retracted Length (A)		Each

Slimline Nonrotating Aluminum Air Cylinders

An innovative oval piston design gives you a nonrotating rod in a space-saving rectangular body. Mounting holes (see dimension F) on the side allow multiple cylinders to be attached side-by-side for incrementally higher force. All cylinders are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are not repairable, which means you simply replace them when necessary.

Cylinders have an aluminum barrel and end caps. The piston rod is 300 series stainless steel for 1/2" to 1" bore size cylinders; Type 420 stainless steel for 1 1/4" to 2 1/2" bore size cylinders. Maximum pressure is 145 psi. Temperature range is 0° to 176° F. ***Attachments—****Flanges* are aluminum. *Pivot brackets* are steel.

To Order For cylinders, please specify stroke length in 1/2" increments from the ranges listed.

Rod Alignment Couplers

Thread these couplers onto your air- or hydraulic-cylinder rod ends to put an end to misalignment problems. These couplers allow misalignment between your cylinder and the driven component. They reduce rod seal and bearing wear as well as prevent binding and erratic movement. Each has a male and female end.

Type 303 stainless steel offers good corrosion resistance.

Type 316 stainless steel offers excellent corrosion resistance. *Metric models* have a silicone dust cover, which keeps contaminants out to extend service life.

For additional information about these products, go to mcmaster.com and search for **6184KAC**.

Rodless Air Slides

Low-Profile Slide

Standard Slide

Get a long stroke length in a much smaller footprint. These slides are similar in function to air cylinders but without a piston rod. Instead, the carriage is connected to an internal piston. All are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. Slides are repairable, simply use the replacement seal kits. **To Order:** For all slides, please specify stroke length in 1″ increments from the ranges listed.

Low-Profile Slides— An oval piston design gives these slides a lower height so they fit right into small spaces. Barrel is anodized aluminum. Carriage cover and end caps are plastic. Maximum pressure is 115 psi. Temperature range is 32° to 140° F.

Standard Slides— Mounting holes slide along the length of the carriage, allowing an adjustable range for (E). These slides also have adjustable cushions to decelerate the slide and absorb noise and vibration. Barrel and carriage are anodized aluminum; end caps are pressure die cast aluminum. Maximum pressure is 145 psi. Temperature range is –22° to +176° F.

Attachments— All are made of aluminum. *End lugs* are for general purpose mounting. *Support brackets* offer intermediate support for long slides and are better for heavier loads.

ⓘ For additional information about standard rodless air slides, go to mcmaster.com and search for **59675KAC**.

Guided Rodless Air Slides

Switch

Similar to the Low-Profile Rodless Air Slides above, except these have an external guide to handle your heavier duty applications. Plus, the piston and carriage are magnetically coupled for low wear. *Note:* The push/pull force is limited by the magnetic holding power.

Slides are switch ready and double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are repairable, simply use the replacement seal kits. Barrel is Type 303 stainless steel. Carriage and end caps are anodized aluminum. Maximum pressure is 101 psi. Temperature range is 14° to 140° F.

To Order: For slides, please specify stroke length in 1″ increments from the ranges listed.

Also Available: Replacement seal kits. Please ask for 1170K9 and specify slide bore size.

Air Slides

Combine the convenience of a slide table with a built-in air cylinder. Also known as linear thrusters, these slides are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are repairable, simply use the replacement seal kits. They are also switch ready.

Carriage and mounting plate are anodized aluminum alloy. Piston rod is steel. Maximum pressure is 150 psi. Temperature range is –20° to +180° F.

To Order: For air slides, please specify stroke length from those listed.

Shown with Switch (Sold Separately)

Adjustable Air Slides

Fine tune your stroke length—adjustable shaft collars on the guide rods allow you to precisely adjust stroke. Plus, slides have heavy duty construction, making them more durable and capable of handling side loads. All are double acting—they have two compressed air ports: one to extend in the "push" direction and another to retract in the "pull" direction. They are nonrepairable, which means you simply replace them when necessary. They are switch ready. Carriage and tool plate are anodized aluminum. Piston rod is Type 303 stainless steel. Max. pressure is 250 psi. Temp. range is –10° to +165° F. **To Order:** For slides, please specify stroke length in 1″ increments from the ranges listed.

Compact Rotary Air Actuators

Their small size and low torque output make these actuators perfect for turning shafts at a fixed rotation in light duty applications. Actuators have a vane design—air pressure pushes the internal vane, which is connected to and rotates the shaft. The shaft does not have a keyway. Unlike indexing tables, actuators are double-acting—they have two compressed air ports: one to rotate in a clockwise direction and another to rotate in a counterclockwise direction. They are repairable, simply use the replacement seal kits.

Body is aluminum alloy. Port pipe size is 10-32 UNF female, unless noted. Maximum pressure is 100 psi, unless noted. Temperature range is 40° to 140° F.

***Reed Switch Kits*—**Use these kits to make these actuators switch ready. Kits include two 100 VAC/24 VDC reed switches, an external magnet, and a bracket.

To Order: For actuators, please specify 90°, 180°, or 270° shaft rotation.

Also Available: Repl. seal kits. Please ask for 6508K1 and specify actuator OD.

★ Port size for 270° shaft rotation is M3. ● Maximum pressure is 140 psi.

Easy-Mount Compact Rotary Air Actuators

Similar to the Compact Rotary Air Actuators above, except these have mounting holes on all four sides for easy top, bottom, and side mounting. Actuators have a rack-and-pinion design for precise positioning and no backlash. Unlike indexing tables, they are double-acting—they have two compressed air ports: one to rotate in a clockwise direction and another to rotate in a counterclockwise direction. Actuators are nonrepairable, which means you simply replace them when necessary. They are switch ready. Body is aluminum. Port pipe size is M3×0.5 female. Maximum pressure is 100 psi. Temperature range is 32° to 140° F. **To Order:** For actuators, please specify 90°, 100°, 180°, or 190° shaft rotation.

Shown with Switch (Sold Separately)

Adjustable-Angle Rotary Air Actuators

Shown with Switch (Sold Separately)

Also known as rotary tables, these actuators adjust from 0° to 190° to rotate clockwise or counterclockwise in small increments. A rotation indicator is included to ensure high accuracy. Actuators have a rack-and-pinion design for precise positioning and no backlash. Mounting holes on the base mean you won't need a shaft coupling. Unlike indexing tables, these actuators are double-acting—they have two compressed air ports: one to rotate in a clockwise direction and another to rotate in a counterclockwise direction. They are repairable, simply use the replacement seal kits. They are also switch ready.

Body is aluminum alloy. Max. pressure is 145 psi. Temperature range is 32° to 140° F.

Also Available: Repl. seal kits. Please ask for 1299K1 and specify actuator part number.

Heavy Duty Rotary Air Actuators

½″ and ¾″ Bore Size

1⅛″ to 2½″ Bore Size

Heavy duty rack-and-pinion gears and a keyed shaft guarantee exceptional torque output, precise positioning, and good durability. Shafts turn at fixed 90°, 180°, 270°, or 360° rotation (unless noted) and have standard ANSI keyways (see page 1174 for keyway dimensions). An adjustment screw allows you to reduce the fixed angle by as much as 30%. Unlike indexing tables, actuators are double-acting—they have two compressed air ports: one to rotate in a clockwise direction and another to rotate in a counterclockwise direction. They are repairable, simply use the repair kits. They are not switch ready.

Body is anodized aluminum. Maximum pressure is 150 psi. Temperature range is –20° to +200° F.

To Order: For actuators, please specify shaft rotation: 90°, 180°, 270°, or 360° (unless noted).

Also Available: Repair kits. Please ask for 60165K1 and specify actuator bore size.

Air-Powered Grippers

1

Open *Closed*

2

3

5791K11

4

Great for pick-and-place as well as component assembly jobs. All have an aluminum body and grasp components when grippers are in the closed position. *Note:* Choose a gripper with a holding force at least ten times your component's weight.

***Single-Acting Grippers with Spring Return*—**Require air in one port for the "closed" position. When air is exhausted, an internal spring returns them to the "open" position. They are normally open.

***Double-Acting Grippers*—**Require air in one port for the "closed" position and air in the second port for the "open" position.

(1) Parallel grippers allow you to grip light loads in narrow spots. Fingers are stainless steel. *Double-acting models* also grasp items in the open position. ***(2) Parallel wide-jaw grippers*** have rugged rack-and-pinion gear construction for extended gripping width with good holding force. Fingers are aluminum. ***(3) Parallel heavy duty grippers*** have a unique double-wedge design for excellent rigidity. Fingers are tool steel. *Double-acting models* also grasp items in the open position. ***(4) Angular grippers*** have an opening angle from +30° to –10°. Fingers are carbon steel.

About Vacuum Cups

Vacuum cups grip objects by using a pump or vacuum generator to draw air from under the cups to create a vacuum seal between the cups and your object. To release the object, the cups have a shut-off to break the vacuum seal.

Load capacities are determined by vertically lifting an object (horizontally lifting an object for Rubber and Oval Vacuum Cups) from a flat, horizontal position and represent limits under ideal conditions. They are calculated by using the inches of mercury (″ Hg) scale and typically range from 5″ to 29″ Hg. The higher the number, the stronger the hold. Variations in surface texture and altitude as well as the presence of oils or fluids may affect the ratings.

Note: Never exceed load capacities or use for overhead lifting.

Vinyl Vacuum Cups

Great for replacing worn-out cups from most vacuum systems, these cups are for use with your existing fittings. The cups have an unthreaded hole you press onto your fitting or they have an aluminum 3/8″ NPT female threaded insert that acts as a mounting hole and vacuum connection (see listing).

All of these cups are made of high-quality vinyl. They have excellent wear resistance but low oil resistance. Maximum temperature is 120° F. Load capacity is based on a maximum vacuum of 18″ Hg. Color is blue.

● Has an untreated aluminum insert.

Rubber Vacuum Cups

Lift and position light-gauge materials with flat, textured, and contoured surfaces. All cups are blue rubber and have a cast-aluminum female fitting. Maximum temperature is 230° F. Load capacity is based on a maximum vacuum of 24″ Hg.

Style 7 have one through-hole opening (D) for both mounting and vacuum connection. ***Style 8*** have one blind-hole opening (D) for mounting and one through-hole opening (E) for vacuum connection.

Soft-Touch High-Strength Vacuum Cups

Offering flexibility as well as strength, these cups consist of two grades of nonmarking polyurethane bonded together. Their soft yellow lip easily adjusts to surface contours, and their harder, blue-green body provides rigidity.

All cups have an aluminum NPSF (National Pipe Straight Fuel; a variation of Dryseal) female fitting. Maximum temperature is 122° F. Load capacity is based on a maximum vacuum of 27″ Hg.

Oval Vacuum Cups

Picking up long, thin objects is made easy with these oval vacuum cups. ***Flexible cups*** are the choice for curved, rough surfaces. ***Rigid cups*** work best with flat, smooth surfaces.

Rubber— Made of wear- and oil-resistant rubber, these cups have three zinc fittings. The center vacuum-line fitting has 3/8″ NPT female threads; two outside mounting fittings have 5/16″ UNC female threads. Max. temp. is 225° F. Load capacity is based on horizontal use and a maximum vacuum of 27″ Hg. Color is black.

Polyurethane— Made of nonmarking polyurethane, these cups provide excellent elasticity and wear resistance. They have an aluminum vacuum-line fitting with 3/8″ NPSF (National Pipe Straight Fuel; a variation of Dryseal) female threads and two 0.118″ dia. outside mounting holes. Max. temp. is 122° F. Load capacity is based on a maximum vacuum of 27″ Hg. Color is red for the flexible cup; green for the rigid cup.

Irregular-Surface Vacuum Cups

The soft foam rubber ring in these cups forms a seal that adjusts to curves and contours for gripping corrugated material, cardboard, packaged food, rimmed cans, bags of seed, and more. Cup body is acetal with a threaded mounting hole. Maximum temperature is 212° F. Load capacity is based on a maximum vacuum of 27″ Hg. Color is black.

BSPP—British Standard Pipe Parallel.

All-In-One Vacuum Grippers

Avoid the problems associated with a centrally located vacuum pump and remote cups. These compact grippers have a vacuum pump, yellow-green polyurethane cup, and an aluminum housing all in one unit. They connect to any compressed air source and operate at 45 psi. Air consumption is 1 scfm. Overall length is 4.37″. Max. temperature is 122° F. Load capacity is based on a maximum vacuum of 27″ Hg. Mounting fasteners included.

Vacuum Cup Assemblies

With Female Fitting — *With Female Fitting* — *With Female Fitting* — *With Male Fitting*

Choose from synthetic rubber and silicone cups with male or female fittings, unless noted. Load capacity is based on a maximum vacuum of 24″ Hg (except for 5427A62, 3766A62, and universal-style cups, which are 27″ Hg). For information on load capacities, see page 1009.

Rubber offers good oil and abrasion resistance. Maximum temperature is 230° F. Color is black. ***Silicone*** has a maximum temperature of 600° F and is translucent clear (except for 3766A62 and universal-style cups, which have a maximum temperature of 392° F and are red).

(A&B) Bellows-style cups compensate for variations in level and vertical movement. Good for curved surfaces. The 2½ bellows cups provide more flexibility than the 1½ bellows cups.

(C) Flat-style cups are for flat surfaces where movement is minimal.

(D) Universal-style cups have a compact design that's suitable for flat as well as slightly curved surfaces.

To Order: For all vacuum cup assemblies, please specify male or female fitting (except for 10-32 UNF and universal-style cups, which are male only) and fitting size from those available below.

Also Available: Replacement vacuum cups. Please ask for 5427A88 for rubber vacuum cups or 5427A99 for silicone vacuum cups and specify vacuum cup assembly part number.

Squeeze-Vac Vacuum Pickup Tools

Simply squeeze and release the finger-size bulb to create a vacuum to lift glass slides, optics, and small parts. After positioning your parts, squeeze the bulb again to release. Sets include a rubber bulb and seven metal tips with static-dissipative (ESD safe) vacuum cups for flat, nonporous surfaces. Furnished in a plastic box.

Buna-N Cups— You'll get five straight tips with 3/32″, ⅛″, ¼″, ⅜″, and ½″ dia. cups as well as two bent tips with ⅛″ and ¼″ dia. cups.

Silicone Cups— You'll get five straight tips with 3/32″, ⅛″, 3/16″, ¼″, and ⅜″ dia. cups as well as two bent tips with ⅛″ and 3/16″ dia. cups.

Cup Material	Max. Temp.	O'all Lg.	Color		Per Set
Buna-N	248° F	4¾″	Black	54195A49	$24.57
Silicone	600° F	2⅞″	Clear	54195A52	51.66

Push-Button Vacuum Pickup Tool

Just press and release the button on this pen-sized tool to create a vacuum to lift a variety of small parts. After positioning your parts, press the button again to release. This tool lifts up to 5 oz. at 5″ Hg using the included ⅜″ dia. cup. Great for laboratory work and small-parts assembly jobs.

Set includes a 5¾″ long tool with brushed anodized aluminum body and four metal tips with silicone vacuum cups for flat, nonporous surfaces. You'll get one straight tip with a ¼″ dia. cup and three bent tips with ⅛″, ¼″, and ⅜″ dia. cups. A storage compartment in the tool holds the tips. Maximum temperature is 480° F. Tool body and cups are blue.

3718A71 ..... **Per Set** $52.15

Replacement Tips with Cups

Straight Tip

Bent Tip

For use with flat, nonporous surfaces. Tips are metal.
Buna-N Cups— Maximum temperature is 248° F.
Silicone Cups— Maximum temperature is 480° F.
To Order: Please specify Buna-N or silicone cups.

Cup Dia.	Straight Tips	Each	Bent Tips	Each
⅛″	3718A77	$3.19	3718A72	$3.19
¼″	3718A73	3.19	3718A74	3.19
⅜″	3718A75	3.19	3718A76	3.19

All-In-One Vacuum Pickup System

Pick up and release parts with fingertip control. This continuous-vacuum system is quiet and static dissipative (ESD safe). It will lift up to 8 oz. at 5″ Hg. Just press the button on the probe to release. System includes an aluminum pen-shaped probe, 4 ft. of coiled vacuum hose, and nine metal tips with black Buna-N rubber vacuum cups (four straight tips with ⅛″, ¼″, ⅜″, and ½″ dia. cups; five bent tips with 3/32″, ⅛″, 3/16″, ¼″, and ⅜″ dia. cups). It operates on 110 VAC, 60 Hz. Overall size is 6″ Lg. × 2½″ Wd. × 3″ Ht. Max. temp. for cups is 248° F. For use with flat, nonporous surfaces.

5670A2 ..... **Each** $182.91

9-Piece Replacement Tip with Cup Set— Contains one of each tip with cup listed above.

5670A66 ..... **Per Set** $24.68

Also Available: Replacement probe and tips with vacuum cups. For probe, please ask for 5670A5. For tips with vacuum cup, please ask for 5670A8 and specify straight or bent tip, and cup size.

Accessories for Vacuum Cup Assemblies

Swivel Connectors

Attach to a vacuum cup (not included) for 360° rotation with up to a 45° angle. Connectors have one male end and one female end with the same size NPT threads.

Thread Size	O'all Lg.		Each
¼″	2 23/64″	6176A4	$60.36
⅜″	2 23/64″	6176A6	62.68

Spring Plungers

Use with your compressed air source and a vacuum cup (not included) for precise horizontal handling. Plungers have an internal spring and include two mounting washers. Threaded end connectors are M5 female with ⅛″ BSPP male adapters.

Extended Lg. (A)	Stroke Lg. (B)	Mounting Thread Lg. (C)		Each
1 21/32″	9/32″	23/32″	5306A1	$45.68
1 15/16″	3/8″	7/8″	5306A2	45.68
2⅞″	25/32″	1 9/16″	5306A3	55.94
4 11/16″	1 9/16″	2 17/32″	5306A4	55.94

Mini Vacuum Generators

(Shown w/Cup)

Also known as venturi devices, connect your compressed air source to create a vacuum generating system. Vacuum cup is not included. Max. vacuum given is for the generator without a cup attached.

Max. Vacuum	Air Consumption @ Max. Vacuum, scfm	O'all Lg.	Air Connection, BSPP Female	VACUUM CUP CONNECTION ⅛″ BSPP Female	Each	¼″ BSPP Female	Each
26.5″ Hg	0.42	1 3/8″	¼″	5293A4	$29.90	5293A7	$29.90
26.5″ Hg	0.74	1 3/8″	¼″	5293A5	29.90	5293A8	29.90
26.5″ Hg	1.26	1 3/8″	¼″	5293A6	29.90	5293A9	29.90

Hydraulic Pressure Regulators

Use these regulators to throttle down pressure in your hydraulic pressure line. All have a cast iron body and 1/4″ gauge port (gauge not included). Maximum temperature is 150°F. Maximum pressure is 3,000 psi. Ports are NPT female.

Port Pipe Size	Max. Flow, gpm	Regulating Range, psi	O'all Size, Lg. × Wd. × Ht.		Each
3/8″	13.2	100-1,000	6.1″ × 3.2″ × 5.8″	9474T11	$191.21
3/8″	13.2	500-2,000	6.1″ × 3.2″ × 5.8″	9474T12	191.21
3/8″	13.2	1,000-3,000	6.1″ × 3.2″ × 5.8″	9474T13	191.21
3/4″	33	100-1,000	7.1″ × 3.7″ × 5.9″	9474T21	276.19
3/4″	33	500-2,000	7.1″ × 3.7″ × 5.9″	9474T22	276.19
3/4″	33	1,000-3,000	7.1″ × 3.7″ × 5.9″	9474T23	276.19

Hydraulic Flow Control Valves

Just turn the dial to control the flow of hydraulic fluid equally in both directions. Body is cast iron. Maximum pressure is 3,000 psi. Inlet and outlet are NPT female.

Valves with check valve are also known as hydraulic cylinder control valves.

Inlet	Outlet	Max. Flow, gpm	O'all Size, Lg. × Wd. × Ht.		Each
Without Check Valve					
3/8″	3/8″	8	2.76″ × 1.65″ × 5.63″	4431T11	$60.58
3/4″	3/4″	20	3.94″ × 2.44″ × 5.37″	4431T12	118.82
With Check Valve					
3/8″	3/8″	8	2.76″ × 1.65″ × 7.08″	4431T21	78.95
3/4″	3/4″	20	3.94″ × 2.44″ × 8.46″	4431T22	142.11

Color-Set Adjustable Flow Control Valves

Each of the five colored rings on the valve stem represents a different flow rate, making it easy to remember your flow-rate setting. Simply adjust the knob to the different colors to achieve the flow rate you need. Inlet and outlet are NPTF female. *Note:* NPTF threads (Dryseal) are compatible with NPT threads.

Brass Valves— For use in air flow as well as hydraulic flow applications.

Steel Valves— For use in hydraulic flow applications.

Steel

Inlet	Outlet	Max. Flow, gpm	O'all Size, Lg. × Wd. × Ht.	Brass: Max. Pressure, psi	Brass:	Brass: Each	Steel: Max. Pressure, psi	Steel:	Steel: Each

Hand-Operated Hydraulic Control Valves

Easily control hydraulic power to your cylinder or press with these hand-operated valves. Both valves are two-pressure-output (4 way) valves, which are most often used for double-acting cylinders. They are also spring return (a spring returns the valve to its original position once you let go of the lever). Body is cast iron. Ports are NPT female.

Pressure Outputs (Ways)	Positions: No.	Positions: Center	Max. Flow, gpm	Max. Operating Pressure, psi	No. of Ports	Port Pipe Size	O'all Size, Lg. × Wd. × Ht.		Each
2 (4)	2	———	25	3,000	4	3/8″	6.9″ × 2.9″ × 10″	4393T1	$132.81
2 (4)	3	Closed	25	3,000	4	3/8″	6.9″ × 2.9″ × 10″	4393T2	132.81

Solenoid-Operated Hydraulic Control Valves

These electrically operated valves mount to a base or manifold, so you can use a single hydraulic source for multiple valves. They conform to NFPA D03 or D05 mounting patterns (also known as ISO sizes 3 and 5). Each valve of the same trade size fits the same manifold. For example, you can put a D03, 2-position, single-solenoid valve and a D03, 3-position, double-solenoid valve on the same manifold.

Valves— Must be mounted to a single-station base or manifold. All are two-pressure-output (4 way) valves, which are most often used for double-acting cylinders. They have four ports, which mate with the base or manifold so direct piping is not required. They also have a cast iron body, an IP67 rated conduit terminal, and operate on 120 VAC. Maximum pressure is 4,500 psi. Ports are NPT female.

D03 trade size valves draw 26 watts of power and have a maximum flow of 16.8 gpm; *D05 trade size valves* draw 32 watts of power and have a maximum flow of 32 gpm.

Single-Solenoid Valves— The valves move into position when electrical current is supplied. Once the current is turned off, the valves return to their original position via an internal spring.

Double-Solenoid Valves— Valves move into one position when electrical current is supplied to the first solenoid; move into another position when current is supplied to the second solenoid. When current is turned off, valves return to their center position via an internal spring.

Single-Station Bases— Use to mount a single valve. Made of cast iron. Ports are NPT female.

Manifolds— Use to mount multiple valves in a single unit. Valves mounted to a manifold share a common input pressure source and tank connection. Made of aluminum. Ports are NPTF female. **To Order:** Please specify 2 or 3 stations.

NFPA Large-Footprint Hydraulic Cylinders

For easy interchangeability, these cylinders comply with large, also known as heavy, NFPA (National Fluid Power Association) and JIC (Joint Industrial Congress) industry standard mounting footprints. They are double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. All have steel end caps, a heavy-wall steel barrel, and high-strength steel tie rods. Piston rod is case-hardened, chrome-plated carbon steel. Maximum pressure is 2,500 psi. Temperature range is –10° to +165° F.

For additional information about these NFPA large-footprint cylinders, including performance data, schematics, and dimensions, go to mcmaster.com and search for **62205KAC**.

★ Pivot pin is not included; order separately. ■ Designed for use with rod clevis; does not mount to cylinder back.

NFPA Medium-Footprint Hydraulic Cylinders

More compact than the large-footprint cylinders above, but still packed with lots of hydraulic power. These cylinders comply with the medium NFPA (National Fluid Power Association) mounting footprint for easy interchangeability. They are double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. All have steel end caps with NFPA MS4-type tapped mounting holes, a brass barrel, and steel tie rods. Piston rod is chrome-plated steel. Temperature range is 0° to 165° F.

■ Designed for use with rod clevis; does not mount to cylinder block.

Miniature Extreme-Force Hydraulic Cylinders

Fabulous force from a small, easy-to-mount threaded-body cylinder. Great for short stroke length applications, these cylinders are single acting—they have one hydraulic pressure port to extend in the "push" direction; an internal spring retracts in the "pull" direction. Cylinder components and accessories are steel. Maximum pressure is 5,000 psi. Temperature range is –40° to +212° F. Port size is 7/16"-20 SAE female, unless noted.

Mounting blocks have two mounting holes, except for 6297K35, which has four. When using a mounting block, a jam nut is required.

♣ Mounting holes fit 5/16" socket-head cap screws. ♠ Mounting holes fit 3/8" socket-head cap screws.

Compact Hydraulic Cylinders

Just because you have a limited amount of space doesn't mean you have to settle for a limited amount of hydraulic power. Pick these cylinders to handle your high-pressure applications that require a compact mounting footprint. They are double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. All have an aluminum body and chrome-plated steel piston rod. Maximum pressure is 2,320 psi. Temperature range is 14° to 140° F.

Low-Pressure Hydraulic Cylinders

These round-body cylinders give you low-pressure hydraulic power and control with a slim profile. They're perfect for mobile hydraulic applications. All of these cylinders are double acting—they have two hydraulic pressure ports: one to extend in the "push" direction and another to retract in the "pull" direction. Body is aluminum. Piston rod is Type 303 stainless steel. Maximum pressure is 507 psi. Ports are 1/8" NPT female. Temperature range is 14° to 140° F.

Hydraulic Motors

When electric power is not available or not desired for safety reasons, choose these hydraulic motors. They produce rotary power at about the same rpm, but with much greater torque than similar-sized air-powered motors. All have a roller-vane design, which delivers high torque and efficiency. Rotation is reversible. Shaft diameter is 1", shaft length is 1.52", keyway is 1/4" Wd. × 1" Dp., and body is 3.76" dia. Motors have a four-bolt flange for mounting with a 3 1/4" bolt circle and four 3/8"-16 mounting holes. Ports are 1/2"-14 female. Minimum oil viscosity is 50 SSU (Saybolt Seconds Universal). Maximum oil inlet temperature is 200° F. Housing is cast iron.

Hydraulic Pumps and Pump-to-Motor Adapters

To create hydraulic energy, combine one of these pumps with a motor (not included). Pump-to-motor mounting adapters are sold below.

Hydraulic Pumps

6296K11

All of these gear pumps have a straight shaft with ANSI keyway (see page 1174 for keyway dimensions). They also have SAE female inlet and outlet threads.

4F17— Housing is cast iron. Rotation is clockwise or counterclockwise. Pumps are 90% efficient. Temp. range is –20° to +300° F.

SAE-AA— Shafts have woodruff keyways (0.125″ Wd. × 0.625″ Dia.). Housing is aluminum. Rotation is clockwise when facing shaft end. Pumps are 93% efficient at up to 200 psi. Temp. range is –40° to +185° F.

SAE-A— Housing is aluminum. Rotation is clockwise when facing shaft end. Pumps are 90% efficient. Temp. range is –20° to +200° F.

SAE-B— Housing is aluminum with cast iron end covers. Rotation is clockwise when facing shaft end. Pumps are 95% efficient. Temp. range is –20° to +200° F.

Pump-to-NEMA-C-Face Motor Adapters

62905K43

Mate NEMA C-face motors to the mounting flange of hydraulic pumps with these adapters. The aluminum housing reduces noise and protects the shaft and coupling connection between the motor and the pump.

All-in-One Hydraulic Power Units

Compact

Standard

You'll get a fixed-displacement hydraulic gear pump, AC motor, oil reservoir, breather vent, and connections—all in one unit. Pump housing is aluminum. Motor is totally enclosed fan cooled and has a steel housing. Choose a unit with a reservoir that's about three times your requirement to allow for heat dissipation. All units must be hardwired. Ports are female.

Compact— A plastic reservoir lets you visually check the oil level. Reservoir port is 3/4″ NPT. Outlet pressure port at base is 3/8″ NPT. Base return port is 1/4″ NPT. Pumps are 75% efficient. Maximum temperature is 130° F.

Standard— All include a suction strainer and return filter to protect pump from contamination, a glycerin-filled pressure gauge, and an oil gauge with thermometer. Reservoirs have 1 1/16″-12 SAE outlet and return ports; 3/4″ NPTF (Dryseal) spare return port (except 62915K31 and K32, which have 7/8″-14 SAE outlet and return ports; 3/4″ NPTF [Dryseal] spare return port). Reservoir drain is 1 1/16″-12 SAE with plug. Pumps are 95% efficient. Max. temp. is 160° F.

● Amps listed are at 230 VAC for compact units; 460 VAC for standard units.

Air-to-Hydraulic Power Converters

Convert up to 80 psi of compressed air into an equal amount of hydraulic pressure without pumps and accumulators. Power units work with hydraulic oil to feed valves and cylinders as well as replenish reservoirs over long distances. Simply apply air to the air inlet port to force fluid out of the hydraulic outlet port. Base is aluminum, reservoir is plastic, and seals are Buna-N. Max. temp. is 140° F. Inlet and outlet ports are female. See pages 1012-1013 for hydraulic cylinders; page 1011 for hydraulic valves.

Reservoir Cap., cu. in.	Air Inlet Port	Hydraulic Outlet Port	O'all Dia.	O'all Ht.		Each
6.9	1/8″ NPT	1/4″ NPT	2 1/2″	4 1/8″	12815K61	$104.34

Air-Powered Hydraulic High-Pressure Converters

Create hydraulic pressure with compressed air. To use, manually fill the reservoir with hydraulic oil and apply air to the inlet port to force the hydraulic oil out of the outlet port at higher pressure. Turn off the air and oil will flow back into the converter through the same port. Converters have a transparent acrylic oil reservoir, composite tube, and spring return. Maximum inlet air pressure is 100 psi. Maximum temperature is 180° F. Inlet and outlet ports are female.

Max. Output Volume, cu. in.	Pressure Ratio	Reservoir Cap., cu. in.	Air Inlet Port	Hydraulic Outlet Port	Overall Size, Lg. × Wd. × Ht.		Each

Hydraulic Reservoirs and Accessories

(A-D) Reservoirs

Store hydraulic fluid in these reservoirs. All have an oil level gauge, breather vent, female drain port with male plug, and a temperature gauge with 0° to 250° F readout.

***Style A*—**Have 11-ga. steel walls and a 7-ga. steel top plate with gasket. 62945K14 and K15 have a 6″ dia. end cleanout cover.

***Style B&C*—**A baffle separates the return side from the inlet side to allow particles to settle before return fluid mixes with inlet fluid. It also prolongs pump life. Baffle and reservoirs are 11-ga. steel, unless noted. *Style B* have two end cleanout covers (6″ dia. on 10- to 40-gal. reservoirs; 12″ dia. on 60- and 100-gal. reservoirs). *Style C* have a 1/4″ thick steel top.

***Style D*—**More corrosion resistant than steel, these have cast aluminum walls and an 11-ga. steel top plate with gasket.

★ Has a 7-ga. steel top plate.

Motor Base Plate

Made of steel, this plate accepts the following NEMA motor frame sizes: 56C, 143TC, 145TC, 182TC, and 184TC. Size is 9 1/2″ Lg. × 8″ Wd. × 2 1/2″ Ht.

62875K33 ..... **Each** $30.71

Breather Vents

Breather vents provide a filler port for reservoirs while allowing a free flow of fresh air. All have a 40-micron filter.

***NPT Threads*—**Both are nylon.

***Flange Mount*—**Has a chrome-plated steel cap, nylon strainer basket, and rubber gasket. A 2.125″ dia. mounting hole is required. Mounting screws included.

		Each
1/2″ NPT Male	62875K11	$5.83
3/4″ NPT Male	62875K12	5.83
Flange Mount	62875K13	11.51

Pipe Suction Flanges

Seal pipes that pass through the top plate of your reservoir. Each flange has a steel top and bottom plate, internal washer, gasket, and mounting screws.

For Pipe Size	Mounting Hole Dia.		Each

2″	4 5/16″	62875K25	9.40

Breather Vent with NPT Threads

Hydraulic Accumulators

Accumulators increase the efficiency of your hydraulic system by supplementing pump flow and pressure, absorbing shock, and compensating for leakage. They also provide auxiliary hydraulic pressure in emergency situations, such as during pump failure. Housing is steel. Ports are SAE female. For safety, accumulators can't be disassembled under pressure.

Charged models include a 2,100-psi charge of nitrogen, except for 1-pint and 1-qt. models, which include a 1,000-psi charge.

***Bladder-Style Accumulators*—**Have a durable Buna-N bladder bag that's easily replaced through the bottom of the unit (replacement bags sold separately). Accumulators must be mounted within 25° of vertical. Seals are Buna-N. Max. pressure is 3,000 psi. Temp. range is –20° to +200° F. Accumulators and replacement bladder bags are interchangeable with Accumulators Inc., Bosch, Greer, Hydac, Oil Air, Parker, and Vickers models that have the same capacity, body dia., and stem size.

***Piston-Style Accumulators*—**Offer very high flow rates and must be mounted vertically. Maximum pressure is 4,000 psi. Temperature range is –20° to +165° F. All have Buna-N O-ring seals.

***Diaphragm-Style Accumulators*—**All are lightweight, welded, and completely sealed. They can be mounted in any orientation, include a Buna-N diaphragm bag, but are not serviceable. Max. pressure is 3,000 psi. Temperature range is 5° to 180° F.

***Charging and Gauging Assembly*—**Use this assembly to increase or decrease the charge of accumulators. It includes a 10-ft. hose with fittings, adapter with gas valve, bleeder valve, gas chuck, and pressure gauge.

***Solenoid-Operated Safety Dump Valve*—**Safely discharge hydraulic fluid from your accumulator when servicing it or in an emergency situation. If the pump stops, valve immediately opens and discharges fluid in the accumulator to the reservoir. Valve operates on 110/120 VAC, 50/60 Hz. It has 3/4″-16 SAE inlet and outlet ports and a standard DIN electrical connector (2-Pole DIN 43650). Meets OSHA requirements 29CFR1910.147.

Weatherproof Electric Actuators

Self-contained and sealed throughout, these actuators provide maximum protection against harsh environments. For consistent, repeatable push/pull motion, just wire them and connect them with a clevis pin at each end (see pages 3352-3355 for 1/4″ dia. solid clevis pins). All of these actuators fit into tight spaces and have an enclosed electric motor with thermal overload protection. They also include two fixed limit switches, which allow you to stop the actuator at either end of the stroke.

Actuators are Acme-screw driven. The housing is corrosion-resistant aluminum/zinc alloy. Rod is steel. Clevis is aluminum. Duty cycle is 10 seconds on; 30 seconds off. Temperature range is –15° to +150° F.

For additional information about these weatherproof electric actuators, including schematics and dimensions, go to mcmaster.com and search for **6509KC**.

Low-Force Plug-and-Go Electric Actuators

A great substitute for light duty air cylinders, these actuators provide basic push/pull motion without the need for a compressed air supply. They're easy to use because programming and wiring are not necessary. We offer complete actuator systems as well as individual components.

Complete Actuator Systems— You'll get everything you need: an actuator, actuator control, power supply with 6-ft. power cord and two-prong plug, connecting cables, and an additional cable for connection to a PLC if desired. For a description of the contents, please see the individual components below.

Individual Components— To create an actuator system, you will need one of each component listed below:

Actuators are designed for continuous operation and can be nose mounted using the included mounting nut. The housing and rod are made of Type 316 stainless steel. Temperature range is 41° to 104° F. Furnished with a 16-ft. long cable.

24-VDC actuator control provides push-button extend/retract operation. It also has a torque adjustment screw.

100-120 VAC input/24 VDC output power supply has a 6-ft. power cord with two-prong plug.

Actuator control-to-power supply cable measures 16 feet long.

Multi-Position Electric Slide Actuators

Side View of Actuator

Close-Up View of Slide Table

These rodless actuators have a slide table that you can stop at five different positions along the stroke (one at each end and three that you can determine in between). They offer the speed and control of an electric actuator with the ease of an air cylinder. Everything you need is in one compact unit—a separate control box and switch are not required. Just connect the included power supply and plug these actuators into a 110 VAC outlet and start working. Programming and wiring are not necessary.

Actuators include a 24-VDC motor, a 110-VAC power supply, torque adjustment, push-button directional controls, and a 6-ft. power cord with two-prong plug. The rails are hardened steel and the slide table is aluminum. These actuators are designed for continuous operation. Temperature range is 41° to 104° F. CE approved.

Plug-and-Go Electric Actuators and Controls

With simple plug-and-go set up, no programming or hardwiring are required for reliable push/pull motion. *Note:* A complete unit consists of an actuator, a control box, and a hand switch (each sold separately below).

Actuators— All are Acme-screw driven and operate on 24 VDC. They have an enclosed electric motor with thermal overload protection, ABS motor housing, and aluminum rod. Enclosures are IPX4 rated for protection from splashed water. Duty cycle is 1 minute on; 9 minutes off. Temperature range is 50° to 104° F. Mounting holes are 0.47″ dia.

Control Box— Provides 24 VDC output and operates up to four actuators individually. It accepts 120 VAC, 60 Hz input and includes an 8¼-ft. power cord with two-prong plug.

Hand Switches— Have extend and retract buttons.

High-Force Electric Actuators

You'll get basic push/pull motion with less down time. To use, just wire these actuators and connect them with a clevis pin at each end (see pages 3352-3355 for clevis pins). Actuators include an enclosed electric motor with thermal overload protection (unless noted) and brake. Components are sealed in a corrosion-resistant aluminum housing. Temperature range is –20° to +120° F.

Actuators with friction-disc slip clutch can be set to slip at any capacity down to 50 lbs.
Actuators with limit switches are adjustable, allowing you to stop the actuator at any position. They include two switches.
115 VAC actuators have capacitors to smooth out the flow of electricity.

100-lb. Push/Pull Force— Actuators are Acme-screw driven. Duty cycle is 1 minute on; 5 minutes off. Rod is stainless steel.

250-lb. Push/Pull Force— Actuators are Acme-screw driven. Duty cycle is 1 minute on; 3 minutes off. Rod is stainless steel.

500-lb. Push/Pull Force— Actuators are Acme-screw driven. DC duty cycle is 1 minute on; 5 minutes off. AC duty cycle is 500″ per hour. Rod is steel.

1,500-lb. Push/Pull Force— Actuators are machine-screw driven. DC duty cycle is 1 minute on; 5 minutes off. AC duty cycle is 500″ per hour. Rod is steel.

500-lb. Force with Friction-Disc Slip Clutch

1,500-lb. Force with Limit Switches

ⓘ For additional information about these actuators, including schematics and dimensions, go to mcmaster.com and search for **6530KE** for 100-lb. push/pull force, **6530KD** for 250-lb. push/pull force, **6530KA** for 500-lb. push/pull force, or **6530KC** for 1,500-lb. push/pull force actuators.

Washdown Plug-and-Go Electric Actuators and Controls

The choice for washdown applications, all components have an ABS housing that is IP66 rated for protection against dust and power jets of water. You'll also get the benefit of simple plug-and-go set up—no programming or hardwiring is required for reliable push/pull motion. *Note:* A complete unit consists of an actuator, a control box, and a hand or foot switch (each sold separately below).

Actuators— Operate on 24 VDC and are driven by a lead screw. All have an ABS motor housing and steel rod. Duty cycle is 1 minute on; 9 minutes off. Temperature range is 32° to 104° F. Mounting holes are 0.47″ dia.

Control Box— Provides 24 VDC output and operates up to four actuators individually. It accepts 120 VAC, 60 Hz input; has integrated overload protection; and includes a 10-ft. power cord with three-prong plug.

Hand Switches— Have extend and retract buttons as well as an LED operation indicator.

Foot Switch— Has extend and retract buttons.

For additional information about these actuators, including schematics and dimensions, go to mcmaster.com and search for **9005KAC**.

Miniature Electromechanical Clutches

Accelerate loads from zero to full speed in less than three milliseconds. Apply electricity and these clutches rapidly engage; turn off the power, and they instantly disengage. Due to the rapid acceleration and nonslip design of these clutches, some applications may need a slip clutch, coupling, or other shock-absorbing device. These clutches drive in one direction only. Max. rpm is 1,400. They operate on 24 VDC and include wire leads for hardwiring.

Bore (A)	Max. Torque, in.-lbs.	O'all Dia. (B)	Lg. (C)	Wire Lead Lg.	*Clockwise Rotation*	Each	*Counterclockwise Rotation*	Each

Miniature Slip Clutches

In the event of excess torque, these clutches slip to protect motors and drivetrains and ensure safe operation. They resume driving once the load has been reduced.

Clutches drive and slip in both forward and reverse directions to control the torque between two rotating elements. You can adjust the torque level at which the clutches slip without removing them from your shaft. No lubrication is required.

Miniature Air-Powered Slip Clutches

Similar to the Miniature Slip Clutches on this page, except these are air actuated so you can remotely adjust the torque—even during operation. They're an excellent choice for servo mechanisms. The connections are female. No lubrication is required.

Bore (A)	Max. Torque @ 100 psi, in.-lbs.	O'all Dia. (B)	Lg. (C)	Air Inlet Connection (D)		Each

Quick-Release Shaft Collars

Installing and removing these collars is as easy as pushing down and lifting up a clamp lever. They are one-piece clamp-on style and won't mar your shafts. All are aluminum with a black anodized body and gold anodized clamp lever. Set screw (for positioning) is 300 series stainless steel. **To Order:** Please specify bore size from those available below.

Available Bore Sizes (A)	O'all Dia., mm (B)	Wd., mm	Load Cap., lbs.	Screw Size		Each
3/8″, 1/2″, 5/8″	38	10	80	M3	1511K1	$17.72

1 1/4″, 1 3/8″, 1 1/2″	75	15	200	M5	1511K3	35.44

Adjustable Magnetic Clutches

Also known as hysteresis clutches, these magnetic clutches transmit torque through the air—no electricity or air power is needed. Simply use the knurled, easy-to-grip adjustment ring to adjust the torque within the range listed. Then lock the ring with your selected torque in place with the included set screw. All of these clutches have no wearing parts, are highly accurate, and allow repeatable control. They're great for torque overload, torque limiting, and tension control applications. **To Order:** Where applicable, please specify bore size from those available below.

Available Bore Sizes (A)	Torque Adjustment Range, in.-lbs.	Max. rpm @ Full Torque	O'all Dia. (B)	Lg. (C)	Mounting Hole Size (D)	Bolt Circle (E)		Each

Linear Solenoids

Create linear motion simply and economically. All of these steel solenoids have an open box-frame housing, Class B insulation rated to 266° F, and quick-disconnect wiring lugs (3/16″ on open box-frame models; 1/4″ on high-force open box-frame models, unless noted). AC solenoids operate on 60 Hz. Components are UL recognized.

Open Box Frame—*Intermittent-duty models* have a 25% duty cycle with a maximum "on" time of 1 minute (except 70155K13, which has a maximum "on" time of 50 seconds).

Open Box Frame, Pull Style

ⓘ For additional information, go to mcmaster.com and search for **70155KAC**.

High-Force Open Box Frame—Also known as laminated solenoids, the rod and frame are laminated to efficiently move your loads. *Intermittent-duty models* have a 10% duty cycle with a maximum "on" time of 3 minutes (except 7723K1, which has a maximum "on" time of 2½ minutes).

About Electric Motors

AC Motors—The choice for fixed-speed, constant-torque applications.

Voltage Phase—*Single-phase AC motors* are less efficient than three-phase AC motors, but usually cost less and operate on a more commonly available power supply such as 115/208-230 VAC, 60 Hz.

Three-phase AC motors have higher starting torque, higher efficiency, and lower current draw compared to same size single-phase AC motors, but they require a less readily available 208-230/460 VAC, 60 Hz power supply. They usually don't need capacitors, switches, or relays for start-up and are better for heavy duty applications.

DC Motors—Often used where adjustable speed control is required, DC motors have high starting torque and consistent speed/torque over the entire speed range. *DC gearmotors* have lower rpms and higher torque.

Keyways—Motor shafts with keyways have standard ANSI keyways. See page 1174 for keyway dimensions.

Overload Protection—An internal thermostat automatically shuts off the motor when it begins to overheat. *Manual overload protection* has a manual reset button to restart motor. *Automatic overload protection* allows motor to restart itself once it has cooled.

% Full Load Efficiency—How well a three-phase motor converts electrical energy into mechanical energy. For example, a 70% efficient motor drawing 400 watts produces 280 watts of useful energy (400 × 0.70 = 280) and loses 120 watts as heat.

Service Factor—The maximum safe load a motor may be expected to consistently carry. For example, a service factor of 1.35 means that the motor is capable of 35% more hp than its listed rating without damage.

Insulation Class—The maximum temperature a motor can withstand before malfunctioning. It's the sum of the motor temperature and ambient temperature. The later the letter is alphabetically, the higher the temperature rating. Most of our motors are Class A (rated to 221° F), Class B (rated to 266° F), Class F (rated to 311° F), or Class H (rated to 356° F).

Guidelines for Replacing a Motor

When replacing an existing motor, take a look at the specifications on your motor's nameplate and match them to the specifications of our motors. The following are some specifications you must consider:

NEMA AC Motors

For technical drawings and 3-D models, go to mcmaster.com.

NEMA 56 Base-Mount AC Motors

Single Phase Open Dripproof (ODP) Enclosure with Rigid Base

Three Phase Totally Enclosed Fan-Cooled (TEFC) Enclosure with Rigid Base

All of these motors have a NEMA 56 footprint with variations as noted. They're rated for continuous duty and have ball bearings (except for 5990K92 and 5990K94, which have sleeve bearings), Class B insulation rated to 266° F (unless noted), and lead wires for electrical connection (except for 5990K14, K17, K21, K92, K31, and K94, which have a terminal board electrical connection). The motors can be used in either clockwise or counterclockwise rotation; instructions are included. Full load amps shown are at the motor's lowest voltage. Housing is steel.

Single-Phase Motors—These motors have a "start" capacitor to boost the starting torque 200-400% of the rated load, unless stated otherwise. They're more efficient than split-phase motors.

Capacitor start/capacitor run motors have a "start" capacitor as well as a "run" capacitor for higher efficiency and lower operating temperatures.

Model 6223K49 is a permanent split-capacitor motor. It has a capacitor in the circuit to store energy and offer a low starting torque that is 30-150% of the rated load. Use it for high-cycle applications such as direct-drive fans and blowers (it must be mounted in the fan's airflow for proper cooling).

Three-Phase Motors—Have higher starting torque, higher efficiency, and lower current draw compared to same size single-phase motors. They usually don't need capacitors, switches, or relays for start-up and are better for heavy duty applications.

Open dripproof (ODP) enclosures are for reasonably dry, clean, well-ventilated, and usually indoor environments. ***Totally enclosed fan-cooled (TEFC) enclosures*** offer greater protection from the environment than ODP models. They have no vent openings and are cooled by an external fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. ***Totally enclosed nonventilated (TENV) enclosures*** are similar to TEFC, but have lower hp and rely on cooling without a fan. ***Totally enclosed air over (TEAO) enclosures*** are for use within the airflow of a blower or fan they're driving.

Rigid-base motors have a heavy-gauge base that's welded to the housing for maximum support. ***Resilient-base motors*** have rubber isolation rings between the motor mounting hubs and base to dampen vibration and shock.

NEMA 56C C-Face-Mount AC Motors

Single-Phase Open Dripproof (ODP) Enclosure

Three-Phase Totally Enclosed Fan-Cooled (TEFC) Enclosure

The mounting face has tapped holes and a raised rim so you can mount these motors directly to equipment with a matching configuration. All are rated for continuous duty and have permanently lubricated ball bearings, Class B insulation rated to 266° F (unless noted), and lead wires for electrical connection. The motors can be used in either clockwise or counterclockwise rotation; instructions are included. Full load amps shown are at the motor's lowest voltage. Housing is steel.

Single-Phase Motors— These motors have a "start" capacitor to boost the starting torque 175-300% of the rated load. They're more efficient than split-phase motors. *Capacitor start/capacitor run* motors have a "start" capacitor as well as a "run" capacitor for higher efficiency and lower operating temperatures.

Three-Phase Motors— Have higher starting torque, higher efficiency, and lower current draw compared to same size single-phase motors. They usually don't need capacitors, switches, or relays for start-up and are better for heavy duty applications.

Open dripproof (ODP) enclosures are for reasonably dry, clean, well-ventilated, and usually indoor environments. ***Totally enclosed fan-cooled (TEFC) enclosures*** offer greater protection from the environment than ODP models. They have no vent openings and are cooled by an external fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. ***Totally enclosed nonventilated (TENV) enclosures*** are similar to TEFC, but have lower hp and rely on cooling without a fan.

NEMA 56 Dual Base/C-Face-Mount AC Motors

Single-Phase Totally Enclosed Fan-Cooled (TEFC) Enclosure

Three-Phase Washdown Enclosure

Expand your mounting options—these NEMA 56 footprint motors (with variations as noted) have both rigid base-mount and C-face configurations. All are rated for continuous duty and have ball bearings, Class B insulation rated to 266° F (unless noted), and lead wires for electrical connection. Use motors in either clockwise or counterclockwise rotation; instructions are included. Full load amps shown are at the motor's lowest voltage. Housing is steel.

Single-Phase Motors— These motors have a "start" capacitor to boost the starting torque 175-300% of the rated load. They're more efficient than split-phase motors. ***Three-Phase Motors—*** Have higher starting torque, higher efficiency, and lower current draw compared to same size single-phase motors. They usually don't need capacitors, switches, or relays for start-up and are better for heavy duty applications.

Totally enclosed fan-cooled (TEFC) enclosures offer protection from the environment. They have no vent openings and are cooled by an external fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. ***Totally enclosed nonventilated (TENV) enclosures*** are similar to TEFC, but have lower hp and rely on cooling without a fan. ***Washdown enclosures*** are for applications that require frequent high-pressure washdowns. They're also great for areas with extreme humidity. Totally enclosed and fan cooled, they keep most water out and release any water that does enter. All have a Type 303 stainless steel shaft and double-sealed, oversized ball bearings to resist moisture and heat.

NEMA 48 Base-Mount AC Motors

Single Phase Open Dripproof (ODP) Enclosure with Rigid Base

All of these motors have a NEMA 48 footprint with variations as noted. They're rated for continuous duty and have ball bearings (except for 5989K52, 5989K63, and 5990K88, which have sleeve bearings) and lead wires for electrical connection. The motors can be used in either clockwise or counterclockwise rotation; instructions are included. Full load amps shown are at the motor's lowest voltage. Housing is steel.

Single-Phase Motors— These motors have a "start" capacitor to boost the starting torque 200-400% of the rated load, unless stated otherwise. They're more efficient than the split-phase motors and are Class B insulation rated to 266° F (unless noted).

Models 5989K91, 5989K52, and 5989K63 are split-phase motors, which deliver a low-to-moderate starting torque that is 100-175% of the rated load without the use of a capacitor.

Models 6223K42, *K41, K43, K46,* and *K45* are permanent split-capacitor motors, which have a capacitor in the circuit to store energy and offer a low starting torque that is 30-150% of the rated load. Use them for high-cycle applications such as direct-drive fans and blowers (they must be mounted in the fan's airflow for proper cooling). They also have a NEMA 48Z frame.

Three-Phase Motor— Has a higher starting torque, higher efficiency, and lower current draw compared to same size single-phase motors. It usually doesn't need capacitors, switches, or relays for start-up and is better for heavy duty applications. Class F insulation rated to 311° F.

Open dripproof (ODP) enclosures are for reasonably dry, clean, well-ventilated, and usually indoor environments. ***Totally enclosed fan-cooled (TEFC) enclosures*** offer greater protection from the environment than ODP models. They have no vent openings and are cooled by an external fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. ***Totally enclosed nonventilated (TENV) enclosures*** are similar to TEFC, but have lower hp and rely on cooling without a fan. ***Totally enclosed air over (TEAO) enclosures*** are for use within the airflow of a blower or fan they're driving.

Rigid-base motors have a heavy-gauge base welded to the housing for support. ***Resilient-base motors*** have rubber isolation rings between motor mounting hubs and base to dampen vibration and shock.

NEMA 145T C-Face-Mount and Dual Base/C-Face-Mount AC Motors

C-Face Mount

Dual Base/ C-Face Mount

Offering higher starting torque, higher efficiency, and lower current draw compared to same size single-phase motors, these three-phase motors are great for heavy duty applications. Plus, they usually don't need capacitors, switches, or relays for start-up.

All have a totally enclosed fan-cooled (TEFC) enclosure for protection from the environment. They have no vent openings and are cooled by an external fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. All motors can be used in either clockwise or counterclockwise rotation; instructions are included. They have ball bearings and lead wires for electrical connection. Motors are rated for continuous duty. Full load amps shown are at the motor's lowest voltage. Housing is steel.

C-Face Mount— The mounting face is machined with tapped holes and a raised rim so you can mount these motors directly to equipment with a matching configuration. Motors have Class B insulation rated to 266° F.

Dual Base/C-Face Mount— Expand your mounting options—this motor has both rigid base-mount and C-face configurations. It also has Class F insulation rated to 311° F

Three-Phase 208-230/460 VAC @ 60 Hz Motors with No Overload Protection

	hp	rpm	O'all Lg.	Full Load Amps	% Full Load Efficiency	Service Factor		Each

AC Gearmotors

Face Mount

Shaft Dia.

Base Mount

The following are general guidelines for choosing rotations per minute (rpm): For valve operation, use a 1-10 rpm motor. For stirring and mixing applications, use a 20-100 rpm motor. For fan operation, use a motor with an rpm greater than 100.

The simple, shaded-pole design (no start switch or capacitor) of these gearmotors is perfect for your light duty, direct-drive applications. Each gearmotor has a motor and fan matched with a geared speed reducer to lessen speed while increasing torque. Using a gearmotor can eliminate the need for belts, chains, and other speed reducers.

Gearmotors are rated for continuous duty and have an open fan, sleeve bearings, steel gears, Class B insulation rated to 266° F, and lead wires for electrical connection. They also have a clockwise rotation (when facing the shaft end) and are not reversible. Shaft diameter is 0.312″ (0.281″ across flat); shaft length is 1″. Housing is steel. UL listed and CSA certified.

Face-mount motors have eight mounting holes on the face that are tapped for 8-32 screws. ***Base-mount motors*** have four mounting holes on the face that are tapped for 10-32 screws, plus two 0.19″ dia. untapped holes on the base.

Synchronous AC Gearmotors

To help eliminate the need for belts, chains, and other speed reducers, these gearmotors are synchronized with line frequency and load fluctuation to provide precise, constant speed for timing and positioning applications. Each gearmotor consists of a motor and a geared speed reducer to lessen speed while increasing torque. Although the motor operates at very low rpms and has low starting torque, it is highly efficient.

Gearmotors are rated for continuous duty and have sleeve bearings, molded plastic gears, Class A insulation rated to 221° F, and lead wires for electrical connection. They also have a clockwise rotation (when facing the shaft end) and are not reversible. Rated rpm values decrease when operating at 50 Hz. Full load amps shown are at the motor's lowest voltage. Housing is zinc-plated steel. UL recognized.

NEMA 34 Face-Mount Brushless DC Motors with Speed Controller

Close-Up View of Controller Knob

An integrated speed controller allows you to plug these motors into any 120-VAC outlet for quick, easy operation. The controller has a knob to adjust the speed, a switch to change the direction of the motor from clockwise to counterclockwise, and an overload reset switch. There's 10 feet of cable between the motor and the controller so you can mount the controller (which fits in a 2⅞″ Ht.×4″ Wd. cutout) in a remote location.

These brushless motors are rated for continuous duty. They last longer and produce less noise and electromagnetic interference than brush-style DC motors. All are IP50 rated, have a maximum temperature of 100° F, and include a 9-ft. power cord with three-prong plug. Housing is aluminum and steel.

hp	rpm Range	Torque, in.-lbs.	O'all Lg.	Full Load Amps		Each
⅕	0-1,740	8.1	7.4″	2	7200K1	$751.25
⅓	0-1,740	13.4	8.4″	4	7200K2	815.09
⅓	0-3,450	6.5	7.4″	4	7200K3	772.14

For information about electric motors, see page 1020. For speed controllers, see pages 883-884.

NEMA 56 Dual Base/C-Face-Mount DC Motors

With both base-mount and C-face configurations, you have two mounting options. All motors have a NEMA 56 footprint (with variations as noted) and are brush style with an internal permanent magnet. Their brush/spring assembly is removable for easy maintenance. Motors are rated for continuous duty and have ball bearings, Class F insulation rated to 311° F (unless noted), and a junction box with lead wires for electrical connection. They can be used in either clockwise or counterclockwise rotation; instructions are included. You can also use a speed controller (not included) to change the motor speed. Torque remains constant over the entire speed range. Housing is aluminum and steel. UL listed and CSA certified.

Low-Voltage Motors— Great for mobile and generator-powered applications, these motors are totally enclosed nonventilated (TENV), unless noted, for protection from the environment. They have no vent openings and rely on cooling without a fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. For speed controllers, see 7729K on page 883.

High-Voltage Motors— Have a high starting torque to handle heavy loads. All have a totally enclosed fan-cooled (TEFC) enclosure. They're similar to TENV, but are cooled by an external fan. For speed controllers, see 7793K on page 884.

NEMA DC Stepper Motors, Drivers, and Controls

NEMA 17

DC stepper motors make precise shaft positioning and motor speed control possible. Unlike standard motors, stepper motors move in discrete increments to position loads. Operate them in full-step (1.8° per step) or half-step (0.9° per step) mode. In full-step mode, motors can run at up to 10,000 steps per second (maximum rpm is 3,000). All of these face-mount motors are rated for continuous duty and have a brushless design for long life, ball bearings, and lead wires for electrical connection. They can be used in either clockwise or counterclockwise rotation. To reverse rotation, reprogram drivers.

NEMA 8, 11, 14, 23, and ***34 Frame Motors, Drivers,*** and ***Motion Controllers—*** Combine two motors and a motion controller (sold separately) with up to two drivers (sold separately) to create a two-axis motion control system. Motion controller requires a PC or other programming device such as a PLC (programmable logic controller).

Drivers accept DC input voltage and convert it into pulses that drive the stepper motor. All include a heat sink to dissipate heat (except for 6134K61). Drivers can microstep down to 0.23° per step on model 6627T41, 0.9° on model 6134K61, and 0.018° on model 6134K92.

Motion controllers allow independent control of two motors and two drivers. Controller accepts input voltage and converts it into the correct DC voltage to power the driver. Connect your driver directly to the controller. Requires Windows PC software (unless noted) to create your motion-control system (software must be downloaded; PC with internet connection required). An RS-232 cable (sold separately) is also required for connection to your PC.

NEMA 17 Frame Motors with Integrated Driver and Motion Controller— Motors include a driver and motion controller, which accept 12-40 VDC. Requires Windows PC software to create your motion-control system (software must be downloaded; PC with internet connection required). An RS-232 cable (sold separately) is also required for connection to your PC.

● Windows software included.

Adjustable NEMA Motor-Mount Bases

Mount your motor on one of these bases and you can easily adjust its position—they're great for compensating for belt stretch and wear. To select a base, check your motor's nameplate for the NEMA frame size and match it with a base listed (see page 1020 for a nameplate illustration).

(A) Universal Sliding-Bars Base— Accepts almost any NEMA motor frame as well as non-NEMA motor frames up to 2 hp. Hand wheel moves motor forward and back. The choice for variable-speed pulleys.

(B) Adjusting-Screw Bases— *Models* 62035K21-*K27* have a one-piece, formed motor base and a single adjusting screw.

Models 62035K28-*K32* have a fabricated motor base and two adjusting screws.

(C) Sliding-Plate Base— Hand wheel moves motor forward and back. Works well with variable-speed pulleys.

(D) Spring-Loaded Base— The spring allows automatic belt tensioning. For applications where belt stretch may change during operation.

(E) Tilting-Plate Base— Hand crank pivots motor plate up to 30°.

Face-Mount DC Motors

The choice for low voltage, low torque applications, these motors have a square mounting flange and a flat on the shaft to accept set screws for quick equipment connection. The motors are brush style with an internal permanent magnet. Their brush/spring assembly is removable for easy maintenance.

Motors operate on 24 VDC and are rated for continuous duty. They have ball bearings, Class F insulation rated to 311° F, and a junction box with lead wires for electrical connection (except for 59835K61, which just has lead wires). The motors can be used in either clockwise or counterclockwise rotation; instructions are included. To adjust motor speed, use a speed controller (sold separately; see 7729K on page 883). Motors have a totally enclosed nonventilated (TENV) enclosure for protection from the environment. They have no vent openings and rely on cooling without a fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. Housing is aluminum and steel. UL listed.

Miniature DC Motors

With their small diameter, these motors are sized just right for small machinery. The motors are brush style with an internal permanent magnet. Threaded holes on the face allow mounting to your equipment. Shafts do not have a keyway.

All of these motors are rated for continuous duty and have ball bearings (unless noted), a maximum temperature of 311° F (unless noted), and lead wires for electrical connection (unless noted). They can be used in either clockwise or counterclockwise rotation. To adjust motor speed, lower your input voltage or use a speed controller (sold separately; see 7729K on page 883). Housing is steel with yellow chromate finish.

■ Has solder lugs for electrical connection. ● Has sleeve bearings. Maximum temperature is 266° F.

Compact DC Gearmotors

With less than 1/100 hp, these compact gearmotors are great for appliances and valve actuators. Each gearmotor consists of a motor and a geared speed reducer to lessen speed while increasing torque. The motors are brush style with an internal permanent magnet.

All of these face-mount gearmotors are rated for continuous duty and have sleeve bearings, iron and acetal gears, terminal lugs for electrical connection, and four 10-32 threaded mounting studs. They also have a flat on the shaft to accept set screws for easy equipment connection. *Note:* Not rated for temperature.

These gearmotors can be used in either clockwise or counterclockwise rotation. To adjust motor speed, use a speed controller (sold separately; see 7729K on page 883). Housing is die cast zinc.

♦ Has terminal lugs for electrical connection. ♣ Has ball bearings.

DC Gearmotors

Each gearmotor consists of a motor and a geared speed reducer to lessen speed while increasing torque. The motors are brush style with an internal permanent magnet. They operate on 90 VDC, are rated for continuous duty, and have lead wires for electrical connection. They can be used in either clockwise or counterclockwise rotation; instructions are included. To adjust motor speed for 1/8 to 1/2 hp models, use a speed controller (sold separately; see 7793K on page 884). All have a totally enclosed nonventilated (TENV) enclosure (unless noted) for protection from the environment. They have no vent openings and rely on cooling without a fan. Though not airtight, they're suitable for nonhazardous, dirty, damp (but not washdown) environments. Housing is aluminum. UL listed.

Right-Angle Shaft— For 90° motor-to-output shaft mounting. You can attach the output shaft to either side of the gearbox, allowing for left- or right-hand operation. Gearbox has a hardened steel worm with bronze worm wheel and ball bearings. Shaft has a keyway as well as a flat (to accept set screws) for connection to your equipment. Base mount horizontally. Insulation is Class H rated to 356° F.

Parallel Shaft— For in-line use. The 1/17 and 1/2 hp models as well as 6470K88 have a junction box. All have steel gears and needle bearings. Shaft has a keyway for connection to your equipment. Base or face mount (except for 1/2 hp models, which are for base mounting only). Insulation is Class F rated to 311° F.

Right-Angle Shaft

■ Motor has a totally enclosed fan-cooled (TEFC) enclosure, which is similar to TENV, but is cooled by an external fan.

About Air-Powered Motors

Flexible, efficient alternatives to electric motors, air-powered motors convert compressed air into rotary motion. They're also safer to use in some hazardous areas because they don't spark and won't overheat or burn out—even when overloaded. They provide variable speeds and torque values via air control valves, so no costly motor controls are needed.

Unlike most electric motors, air-powered motors can start and stop instantly. For instant rotation reversal, a two-pressure-output (4 way) valve is required but not included (see pages 986-993 for valves). Air-powered motors are great for use with conveyors, hoists, and mixing equipment.

Air-Powered Motors

With a rotary-vane design, these air-powered motors have few moving parts so they require little or no maintenance. Motors run cool and have a muffler to reduce noise. Housing is iron and aluminum.

Motors can be mounted in any position. They do not have a keyway, unless noted. ***Hub-mount motors*** let you clamp a collar over the hub to connect your device. ***Base-mount motors*** have mounting holes on their base. ***Face-mount motors*** have threaded holes on their face. ***NEMA 56C*** and ***145TC face-mount motors*** are drop-in replacements for electric motors with the matching NEMA frame. Their mounting hole patterns, mounting dimensions, and shaft dimensions are identical to those of their electric counterparts.

For best performance, use water- and particle-free (down to 5 microns) compressed air (see our compressed air products on pages 976-982).

Standard—Motors require lubricated air. Maximum pressure is 100 psi (except for 59785K92, which is 80 psi).

Lubrication Free—These motors don't require lubrication so they run cleaner and won't contaminate the air. Maximum pressure is 80 psi.

Air-Powered Gearmotors

Parallel Shaft Face Mount *Parallel Shaft Face/Foot Mount* *Right-Angle Shaft*

Similar to the Air-Powered Motors on this page, except these have a gearbox to deliver high torque at low speeds. Motors have a rotary-vane design and reversible rotation. Housing is iron. For best performance, use lubricated, water- and particle-free (down to 5 microns) compressed air (see our compressed air products on pages 976-982).

Parallel Shaft—For inline use. All have an exhaust muffler, a top air inlet, and threaded mounting holes on the face for easy installation. These gearmotors can also be foot mounted. The *0.3 and 0.32 hp models* require the foot-mount bracket sold separately below. The *1.25 and 1.26 hp models* have an integral base. All mount horizontally or vertically in the shaft-down position.

Right-Angle Shaft—The output shaft is at a right angle to the motor, which allows more mounting options. Mount horizontally.

For information about air-powered motors, see page 1028.

Slimline Nose-Mount Air-Powered Gearmotors

A slim nose-mount design is paired with the low-maintenance advantages of a rotary-vane motor and the power of an integral gearbox for high torque at low speeds. Maximum air pressure is 90 psi. Port size is 1/4″ NPT female. Mount gearmotors in any position. Housing is steel. For best performance, use lubricated, water- and particle-free (down to 5 microns) compressed air (see our compressed air products on pages 976-982).

Flanged Nose— These motors have higher torque at lower speeds than comparable threaded-nose motors. The nose has a built-in flange with two 0.33″ dia. holes for mounting (fasteners not included).

Threaded Nose— Have a left-hand threaded nose for easy connection directly to a machine or to a steel mounting bracket (sold separately below). All come with an exhaust muffler and have a side air inlet.

Stainless Steel Nose-Mount Air-Powered Gearmotors

These metric motors have a smooth stainless steel surface that won't collect dirt and other contaminants—great for food-processing and corrosive-chemical applications. Motors have a rotary-vane design and double fluoroelastomer seals at the shaft to prevent liquids and other contaminants from entering the motor. Rotation is reversible. Unlike face-mount motors, these require either a foot-mount or flange-mount stainless steel mounting bracket (sold separately below). Mount in any position. Maximum air pressure is 90 psi. For best performance, use lubricated, water- and particle-free (down to 5 microns) compressed air (see our compressed air products on pages 976-982).

Miniature Air-Powered Gearmotors and Motors with Push-to-Connect Fittings

Our tiny, precision rotary-vane motors are small in size, but not power. Rotation is reversible. Motors mount with the included flange or you can remove the flange and mount directly using the 5/8″-32 left-hand threads on the motor's nose. Mount in any position. Air inlet ports have push-to-connect tube fittings for use with 1/4″ OD tubing. Shafts do not have a keyway. Housing is aluminum and stainless steel. Use with lubricated, water- and particle-free (down to 5 microns) compressed air as well as nitrogen and inert gases up to 160 psi (see our compressed air products on pages 976-982).

High-Torque Face-Mount Air-Powered Gearmotors

Does your application involve heavy starting loads and frequent starts and stops? The piston design of these motors provides high torque evenly in either direction (rotation is reversible). All motors are enclosed so they're great for use in dusty and corrosive areas. Large shaft bearings withstand overhung weight on the shaft with no external support. Grease fittings permit lubrication. Motors have a face-mount flange with three 1/2″-13 threaded mounting holes. Mount horizontally. Maximum air pressure is 125 psi. Housing is steel and aluminum. For best performance use clean, lubricated air (see our compressed air products on pages 976-982).

End View (All Styles)

Transmit rotary motion without time-consuming maintenance. All have hardened steel gears, sealed ball bearings that require no lubrication, and a cast aluminum housing for good heat dissipation. Install in any position with the flanged ends and integral three-bolt mount. Input shaft operates clockwise or counterclockwise; output shaft spins in the opposite direction. Both shafts have standard ANSI keyways (unless noted; see page 1174 for keyway dimensions). Max. input speed is 3,000 rpm. Meet MIL-I-45208A for inspection system requirements.

Base-Mount Kit

Looking for a smooth, quiet way to reduce your motor's input speed while increasing torque? Choose these reducers, which have a forged-bronze worm gear with a hardened-steel input worm and shaft. They're suitable for replacing Boston Gear and many Grove and Ohio units.

Reducers have a cast iron housing with four mounting holes on the top and bottom for installation flexibility. Input shafts operate clockwise or counterclockwise. All shafts have standard ANSI keyways (see pg. 1174 for keyway dimensions). Max. input speed is 4,500 rpm for models with 1″ and 1.33″ worm center distances; 3,600 rpm for all others. Lubricant is required (sold separately; please ask for 5887K1). ***Shaft Input—*** Connect to motor shafts with couplings (not included; see pages 1174-1185). ***NEMA 56C Input—*** Connect to motors with a NEMA 56C frame.

To Order: For all reducers, please specify left- or right-hand output shaft (refers to output shaft side when you're facing the input shaft).

Switchable-Output Right-Angle Speed Reducers

For maximum mounting flexibility, these speed reducers have a hollow output on both the left- and right-hand sides for mounting onto your motor shaft. They also operate clockwise or counterclockwise and can be mounted in any position.

All of these reducers have a bronze worm gear, steel worm and input shafts, and sealed ball bearings that require no lubrication. They have an aluminum housing that is polyester epoxy painted inside and out for corrosion resistance with integral heat sinks for cool operation. All reducers accept NEMA 56C motors. Maximum input speed is 4,000 rpm.

Optional Plug-In Shafts—These shafts plug into either side of the speed reducers to let you choose left- or right-hand shaft output. They have standard ANSI keyways.

High-Efficiency Speed Reducers

Designed with spur gears, these speed reducers transfer torque more efficiently than speed reducers with worm gears. They also boast a compact parallel shaft design. All have a die cast aluminum housing, a steel shaft with a 0.33″ dia. through hole, and hardened steel gear teeth. Input shaft operates clockwise or counterclockwise; input and output shafts turn in opposite directions. All reducers accept NEMA 56C motors. Maximum input speed is 1,750 rpm.

Ratio	Max. Input hp	Output rpm♣	Output Torque, in.-lbs.	Overhung Load Cap., lbs.★		Each	Ratio	Max. Input hp	Output rpm♣	Output Torque, in.-lbs.	Overhung Load Cap., lbs.★		Each
3.2:1	1.48	539	167	256	6481K73	$237.64	5.6:1	1.48	310	290	246	6481K75	$237.64

♣ At 1,725 input rpm. ★ Force applied perpendicular to the center of the output shaft.

High-Precision Motion-Control Speed Reducers

With more tooth contact and a greater face width than spur gears, the helical planetary-gear design of these reducers provides smooth tooth engagement and little backlash for precise, quiet operation. Great for motion-control applications, they're suitable for use with stepper and servo motors. All can be mounted in any position. Input shaft operates clockwise or counterclockwise; input and output shafts turn in the same direction. Housing and output shaft are Type 416 stainless steel, gears are steel, and motor mounting plate is aluminum. NEMA 23 models have D-shaped output shafts and a max. input speed of 6,000 rpm. NEMA 34 models have standard ANSI keyways on the output shafts and a max. input speed of 5,300 rpm. **To Order:** Please specify ratio from those available below.

★ Force applied perpendicular to the center of the output shaft. ■ 190 in.-lbs. for 10:1 ratio. ▲ 500 in.-lbs. for 10:1 ratio.

Variable-Speed Clutch Drives

Quickly and easily adjust your output speed from a full stop to 1/4 of your input rpm while maintaining constant torque. Use the lever arm to adjust the speed—a locking mechanism accurately holds the speed you set. Maximum input speed is 1,800 rpm (maximum 400 rpm output).

Drives have a cast aluminum housing and mount in any position. They're lubricated and sealed for maintenance-free operation. Output shaft has standard ANSI keyways. **To Order:** Please specify clockwise or counter-clockwise output shaft rotation. *Note:* Rotation is read facing output shaft.

NEMA 56C motor mount adapters permit easy installation on your NEMA 56C motor. They include bolts and a NEMA 56C compatible coupling.

About Roller Chain

Roller chain consists of links held together with riveted pins. Chain size is determined by the pitch, which is the distance between the pin centers. The chain size/ANSI No. is stamped on the side of the chain. Use roller chain with sprockets that have the same ANSI No. (For sprockets, see pages 1040-1046.)

To get the correct length of chain, use a chain breaker (see page 1039) to break the chain and a connecting link to join the two ends. You can also order chain with the exact number of links you need (see Ready-to-Use Custom-Length ANSI Roller Chain on page 1035).

Double-Pitch Roller Chain— Has half as many rollers as standard roller chain, making it lighter and more economical.

Extra Chain Links

Connecting Link

ANSI 25-60

ANSI 80-160

Use a connecting link to join two ends of a length of chain. The link's side plate is easy to remove for assembly. Use the roller chain spring-clip remover on page 1039 to remove the spring-clip from the ANSI 25-60 roller chain.

Adding Link

Also known as roller links, use adding links to increase the length of your chain. *Note*: A connecting link is required to join the ends of the chain.

Add-and-Connect Link

ANSI 25, ISO 04B, and ISO 05B

ANSI 35-160

Also known as offset links, add-and-connect links are a combination of connecting and adding links. They allow you to increase the length of your chain and join the ends.

ANSI Roller Chain

Single Strand

Double Strand

Made of steel, our durable, riveted roller chain is the workhorse of drive chain.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. (unless noted). The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

Heavy Chain— This chain has thicker side plates, which provide a higher load capacity than standard chain.

Acetal with Stainless Steel Side Plates

Choose from treated steel and acetal chain for your wet and corrosive environments. **To Order:** Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. where listed below. The 1-ft. through 10-ft. and 20-ft. lengths include one connecting link, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links (unless otherwise stated).

Treated Steel— Specially treated for washdown and outdoor applications, this carbon steel chain offers high strength in addition to corrosion resistance.

Acetal— Great for sound-sensitive and sanitary environments, this chain is light, quiet, and resistant to chemicals and corrosion.

Standard chain is perfect for pharmaceutical and food processing applications. It's dimensionally interchangeable with metal ANSI chain and has links that snap together, eliminating the need for connecting links. FDA and USDA compliant.

Chain with stainless steel side plates has self-lubricating acetal links with Type 304 stainless steel bearing pins and side plates to provide higher working loads than standard acetal chain.

Warning! ***Do not use the chain on this page for lifting applications or for moving people.***

For information about roller chain, see page 1032.

Lubrication-Free ANSI Roller Chain

Since no lubrication is required, this single-strand chain eliminates problems with oil contamination while reducing maintenance time and costs. *Note:* Standard ANSI chain can be replaced with lubrication-free chain that has the same ANSI number. Although the roller width (C) is slightly narrower, standard ANSI sprockets can still be used.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. (unless noted). The 1-ft. through 10-ft. lengths include one connecting link, 20-ft. lengths include two connecting links, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

Carbon Steel— This chain has oil-impregnated bushings and coated pins for internal lubrication.

Ultra-Premium Carbon Steel— Designed to last up to three times longer than standard ANSI chain, this chain has chrome-plated pins that are hardened to Rockwell 70C. These exceptionally hard pins not only provide strength and wear resistance for extended chain life, but also eliminate the need for lubrication.

Nickel-Plated Carbon Steel— Just like the carbon steel chain above but with better corrosion resistance. Good for use in mildly corrosive environments.

Sealed Carbon Steel— A rubber O-ring seals the lubricating grease in between the bushings and pins while keeping dirt and moisture out to extend the life of the chain.

● Not available in 100-ft. lengths. ★ Not available in 50-ft. or 100-ft. lengths.

Hollow-Pin ANSI Chain

Hollow pin bushings allow you to insert cross rods and attachments into this chain without disassembling it—excellent for customizing your chain system. All of this chain is single strand.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. (unless noted). Lengths through 10 ft. include one connecting link, 20-ft. lengths include two connecting links, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

Type 304 Stainless Steel— Offers good corrosion resistance.

Flexible ANSI Roller Chain

The perfect solution when sprockets can't be exactly aligned, this chain has extra clearance between chain parts so it can curve side-to-side. Chain is made of carbon steel and is single strand.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20 and 50 ft. The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link; 50-ft. lengths include five connecting links.

80	23.622″	1″	0.625″	0.625″	1,700	7274K5	26.39	7274K525	3.40

Warning! ***Do not use the chain on this page for lifting applications or for moving people.***

For information about roller chain, see page 1032.

Low-Temperature ANSI Roller Chain

Just how low can it go? Unlike standard steel roller chain, which can become brittle below +14°F, this chain can handle temperatures down to –40°F. Chain is made of specially designed alloy steel and is single strand. *Note:* When lubricating this chain, use oil that is suitable for your temperature range.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

ANSI No.	Pitch (A)	Roller Dia. (B)	Roller Wd. (C)	Working Load, lbs.	ROLLER CHAIN	Per Ft.	EXTRA CHAIN LINKS Connecting	Each	Add-and-Connect	Each

Ready-to-Use Custom-Length ANSI Roller Chain

No need to cut and connect chain yourself—we'll do it for you. All of this chain is made of carbon steel and is single strand.

To Order: Please specify the number of links per chain (see the ***Counting the links you need*** box) and the quantity of finished chains desired. The number of links to order equals the links per chain multiplied by the quantity of chains. For example, if you need two finished chains with 50 links each, you would need to order a total of 100 links.

Choose ***chain with connecting links***, which allows you to break and remove the chain if needed, or ***fully riveted chain***, which is continuous and stronger.

Counting the links you need

Start at either end of the chain and count every link until you reach the other end. The number of links will be an even number, such as 2, 4, 6, etc.

Double-Pitch ANSI Roller Chain

With half as many rollers as standard roller chain, this double-pitch chain is lighter and more economical. It's the perfect choice for applications with slow to moderate speeds. All of this chain is single strand and can be used with standard sprockets.

To Order: Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

Heavy Chain— This chain has thicker side plates, which provide a higher load capacity than standard chain. ***300 Series Stainless Steel—*** Offers good corrosion resistance.

ANSI Roller Chain Wear-Indicating Gauges

Forget the guesswork—quickly and accurately check the wear (stretch) of your ANSI roller chain. *Note*: You need to know the ANSI size of your chain.

Style 1— To check chain wear, simply place the start arrow on a chain link and look where the end arrow lines up. Gauge is made of laminated cardboard.

Style 2— These gauges couldn't be any easier to use. Just insert them between any two roller links and look where they stop. If the gauges go in past your known ANSI size, your chain is worn out. Gauges are made of precision-ground tool steel.

1

2

	For ANSI Chain Nos.	Lg. × Wd.		Each
1	35-2060	13 3/8″ × 1 7/8″	2370K1	$1.69

ANSI Roller Chain Attachments

Connecting Links

Adding Links

Add these attachments to your ANSI drive chain for conveying, timing, and aligning applications. Move materials directly on the attachments or design your own jigs to install on the attachments.

A-1, K-1, SA-1, and ***SK-1 attachments*** have a hole for mounting parts and hanging hooks. ***D-1*** and ***D-3 attachments*** have pin extensions that are great for tripping switches.

Connecting Links— Join two ends of a length of chain. All include a spring clip, except for *ANSI No. 80 single-pitch connecting links* and all *double-pitch connecting links*, which include a cotter pin.

Adding Links— Increase the length of your chain. *Note:* A standard connecting link (see page 1032) or a single-pitch connecting link (sold below) is required to join the ends of the chain.

Single-Pitch Connecting Links

Miniature Chain

Acetal and Nylatron

Stainless Steel

This single-strand chain fits small machines that ANSI-sized chain can't. Use it with our miniature sprockets (see 64205K and 6789K on page 1042). **To Order:** Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft.

Acetal and ***Nylatron—*** Both styles are self-lubricating, quiet, lightweight, nonconductive, and nonmagnetic. They have links that snap together, which eliminates the need for connecting links.

300 Series Stainless Steel— This corrosion-resistant chain is rollerless. The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link, 50-ft. lengths include 20 connecting links, and 100-ft. lengths include 40 connecting links.

Material	Pitch (A)	Bushing Dia. (B)	Bushing Wd. (C)	Working Load	Chain	Per Ft.	Connecting Links	Each
Acetal	0.1227″	0.06″	0.062″	2 lbs.	64225K72	$12.12	—	—
Nylatron	0.1475″	0.089″	0.072″	6.5 oz.	6865K3	33.85	—	—
300 Series Stainless Steel	0.1475″	0.09″	0.072″	20 lbs.	7142K1	40.96	7142K2	$3.68

For information about roller chain, see page 1032.

British Standard Metric Roller Chain

Excellent for use with low-power and instrument drives, this British standard chain conforms to ISO 606B and is compatible with BS 228 (British standard) and DIN 8187 (German standard). **To Order:** Please specify length. We offer lengths in 1-ft. increments up to 10 ft. as well as lengths of 20, 50, and 100 ft. The 1-ft. through 10-ft. lengths and 20-ft. lengths include one connecting link, 50-ft. lengths include five connecting links, and 100-ft. lengths include 10 connecting links.

18-8 Stainless Steel— Offers good corrosion resistance.

★ Link is double pitch.

Steel Leaf Chain

Also known as counterbalance chain, this strong, flexible leaf chain offers greater tensile strength than roller chain. Use it as a counterweight chain for machine tools, elevator doors, forklift masts, and other similar lifting and balancing applications. It's also good for low-speed pulling. The chain is made of heat-treated steel plates that are interlaced and held together by rivet pins. It is single strand and driven over flat pulleys, not sprockets. Meets ASME B29.8M for leaf chain. **To Order:** Please specify length. We offer lengths in 1-ft. increments from 3 ft. up to 20 ft.

Caution: When servicing worn leaf chain, replace the entire chain. Do not splice chains together. Do not mix old and new chain.

Clevis End Connectors— For fastening the end of the chain to a clevis.

3×4 Lacing *4×6 Lacing*

Clevis End Connector

Roller Chain Holders

Need an extra hand? These holders work like a third hand to help you insert and fasten connecting links.

(A) Compact, ***(B) Knob***, and ***(C) T-Handle Styles—*** Simply hook the jaws into each end of your chain and tighten until chain ends are close enough to insert your new link. All are made of steel.

(D) Cable Style— This holder allows you to keep your chain on the sprocket when adding or removing links. Just insert the hooks that are on each end of the cable onto the rollers beyond the links you want to change. Then tighten with the included box wrench. When the work is done, pull the lever to release the cable and remove the tool. Minimum roller width is ⅝″. Tool is made of steel with a wire rope cable and hardened steel hooks.

	Style	For ANSI Chain Nos.	Pitch	Max. Spread	Lg. × Wd.		Each

Ring-Style Self-Adjusting Roller Chain Tensioners

Reduce chain wear and quiet chain clatter by placing one of these simple rings between two strands of chain—no aligning, adjusting, or lubricating necessary. Made of strong, flexible plastic. Maximum operating temperature is 158° F. Tension force not rated.

Tension Ring in Use

For ANSI Chain No.	Max. Speed, ft./min.	No. of Teeth in Drive Sprocket	Pitch Dia.		Each	For ANSI Chain No.	Max. Speed, ft./min.	No. of Teeth in Drive Sprocket	Pitch Dia.		Each

Warning! ***Do not use the chain on this page for lifting applications or for moving people.***

Floating-Style Self-Adjusting Roller Chain Tensioners

Easy to install, these tensioners get the job done without mounting them to a structure. Each has saddle blocks that ride on your chain between the drive sprocket and driven sprocket and are joined by adjustable straps that take up the slack. They require no lubrication, idler sprockets, or bearings. All are UHMW polyethylene (FDA and USDA compliant for food contact) with a stainless steel housing and zinc-plated steel screws and lock nuts. Max. operating temp. is 200° F. Tension force not rated.

Adjustable and Spring-Loaded Belt and Roller Chain Tensioners

Our drive tensioners take up slack and keep continuous tension on your single-strand chain and belts. Use them with idler sprockets (see 6663K on page 1040) or pulleys (see 6234K on page 1059, 59475K on page 1050, and 6235K on page 1051). Styles 2 and 4 have a tension force of 45 lbs.; others aren't rated. All have mounting slots and fasteners, except Style 5, which has a hole and slot but doesn't include fasteners.

Manually Adjustable Tensioners (1, 3, and 5)—*Styles 1* and *3* have a 360° arm rotation. Tension is applied by adjusting tensioner bolts and slots. *Style 5* adjusts with an adjustment screw and applies tension in a straight line.

Spring-Loaded Automatic Tensioners (2 and 4)—Both styles have a spring-loaded pivot arm, which applies continuous force on your chain or belt. They also have a secondary pivot arm with external springs and swing 180° in either direction.

Automatic-Spring Roller Chain Tensioners

Built-in springs put constant tension on single-strand roller chain. They absorb and buffer momentary overloads, reduce vibration, and improve drive performance. Maximum operating temperature is 180° F for standard tensioners; 140° F for low-profile tensioners. All can be mounted vertically or horizontally.

(6) Standard Tensioners

All have reciprocating steel shafts that are attached to a self-lubricating UHMW polyethylene arc for smooth, quiet operation. Case is die cast aluminum; bearings are sintered bronze. They mount and adjust with a single bolt (not included; use a ⅜″ bolt for 6233K33 and K34, a 7/16″ bolt for K35 and K36, and a ½″ bolt for K37 and K38).

(7-8) Low-Profile Tensioners

Perfect for tight spaces. All have a UHMW polyethylene arc and use two M6 screws (not included) for mounting. *Steel case* is treated with zinc phosphate for corrosion protection. *Type 304 stainless steel case* provides extra corrosion resistance.

Style 8 have elongated mounting holes, which allow adjustment.

UHMW Roller Chain Guides

Minimize friction, reduce noise, and prolong the life of your roller chain with these chain guides. Made of UHMW polyethylene, they can be easily cut to the exact length you need. Maximum operating temperature is 180° F, unless otherwise stated. Color is black, unless otherwise stated. **To Order:** Please specify length. We offer lengths in 1-ft. increments up to 8 feet.

(2-4) Center Channel— Align more precisely than open-channel style.

(5-6) Deep Channel— A corrosion-resistant metal frame allows these guides to expand and contract for easy mounting and replacement.

Style 6 have a flanged frame with mounting holes for extra stability. Holes are every 12″, starting 6″ from the end. Mounting fasteners not included; use 5/16″ bolts. Maximum operating temperature is 176° F.

Roller Chain Spring-Clip Remover

Removing spring clips on connecting links doesn't have to be a pesky chore. Give this handy tool a simple twist and the clips will easily detach. Tool is made of steel.

2372K1 ..... Each $3.08

Roller Chain Breakers

For use on single-strand roller chain, unless noted.

(A) Easy-Turn Style— No extra wrench is required—just turn the handle and the punch point lowers to drive out the pin. Breakers have forged-steel jaws, except for 6051K17, which has cold-rolled steel jaws. All parts are hardened for long life. *Note:* These breakers can also be used on multistrand roller chain.

(B) Wrench-Drive Style— Turn the knurled clamping knob by hand and tighten the hex-head screw with a wrench (not included), and the long, hardened-steel punch pushes the pin out. A clamping sleeve ensures perfect alignment with the pin. Breakers are made of steel.

(C) Breaker/Riveter Style— Use this one tool to break ANSI No. 50 and No. 60 chain as well as rivet No. 50 chain. Bolt it to a workbench (using two 3/8″-24 bolts, not included), support it in a vise, or use it by hand (with included removable handle). A rivet set, rivet anvil, and press plate are included. All parts are heat-treated steel for strength and durability.

For ANSI Chain Nos.	Pitch	Breakers	Each	Replacement Points	Each

Steel Guards for Chains and Belts

Guard Dimensions

All of these 14-ga. steel guards offer protection against belt or chain fly-off, and also protect the drive mechanism from interference. They're primed with one coat of primer and are ready for final paint or enamel coating. To mount, punch screw holes or weld.

Ctr. to Ctr. (A)	Dp. (B)♣	(C)★	(D)★	Lg. (E)		Each

♣ Should be at least width of largest sprocket plus 1″.
★ Center of sprocket to edge of guard (including clearance).

Custom Guards

Similar to the guards above, but custom sizes.

To Order: Step 1: Choose the correct part number you need by determining your ordering size, which is found by adding the center-to-center distance of your sprockets (A) to the OD of your larger sprocket (F). Step 2: Please specify the actual center-to-center distance of your sprockets (A), large sprocket OD (F), small sprocket OD (G), clearance between sprocket and side of guard (H)—standard clearance is 2″, and guard depth—largest sprocket width (J) plus 1″.

Custom Guard Dimensions

Ordering Size—Dimension (A) + Dimension (F)		Each
Up to 18.50″	6248K11	$143.50

48.51″ to 54.50″	6248K23	315.50

Plastic Guards for Chains and Belts

Made of ABS plastic, these protective guards won't rust, can be sterilized, and are great for absorbing impact from chain and belt drives. They're also easy to machine, so drilling holes for venting and mounting is not a problem. All guards have a backplate and a flange to accommodate mounting holes up to 1/4" dia. (we recommend using Forstner bits, which are found on page 2463, to drill the holes). Maximum operating temperature is 200° F. Color is black.

About Sprockets

In order for sprockets and chain to properly mesh, you must select a sprocket that matches your specific ANSI chain number and pitch. *Pitch* is the distance from one tooth valley to the next; this is where the centers of chain pins mesh with the sprocket.

For ANSI chain, see pages 1032-1035. For standard ANSI keyway information, see page 1174.

Idler Sprockets for ANSI Roller Chain

Sprockets with Flat Hub

Double-Strand Sprockets with Flat Hub

Sprockets with Wide Hub

These idler sprockets spin freely on built-in bearings to guide and control slack in your chain.

Nylon and ***UHMW polyethylene sprockets*** are self-lubricating and quiet, as well as corrosion, abrasion, and impact resistant.

Steel sprockets with hardened teeth offer increased wear resistance to extend sprocket life.

Double-strand sprockets are for use with double-strand roller chain.

For information about sprockets, see page 1040. For ANSI chain, see pages 1032-1035.

Machinable-Bore Sprockets for ANSI Roller Chain

Need an uncommon bore size? These sprockets are furnished at the minimum bore size listed below but are machinable up to the maximum bore size. Keyways and set screws are not included. Use with ANSI single-strand chain.

For the sprocket OD, width, and hub diameter for these sprockets, go to mcmaster.com and search for **60425KAC** for nylon sprockets, **6793KAC** for steel sprockets, or **6799KAC** for stainless steel sprockets.

Nylon

No. of Teeth	For ANSI #25 Chain (1/4" Pitch) Bore Size Min.	Max.			For ANSI #35 Chain (3/8" Pitch) Bore Size Min.	Max.			For ANSI #40 Chain (1/2" Pitch) Bore Size Min.	Max.			For ANSI #50 Chain (5/8" Pitch) Bore Size Min.	Max.		
Nylon—*Lightweight, corrosion resistant, quieter, and easier to machine than steel sprockets.*

For information about sprockets, see page 1040. For ANSI chain, see pages 1032-1035.

Steel Finished-Bore Sprockets for ANSI #25-#41 Roller Chain

With their wide hubs and finished bores, these sprockets are ready to mount to a shaft. All are made of steel, have standard ANSI keyways (except for 1/4″, 3/8″, and 1/2″ bore sizes, which do not have keyways), and include two set screws. For use with ANSI single-strand chain.

To Order: Please specify bore size (where necessary) from the available bore range listed below. Available bore sizes are: 1/4″, 3/8″, 1/2″, 5/8″, 3/4″, 7/8″, 1″, 1 1/8″, 1 3/16″, 1 1/4″, 1 3/8″, 1 7/16″, and 1 1/2″.

Sprockets with hardened teeth offer increased wear resistance for longer sprocket service life.

Also Available: Miniature finished-bore sprockets for 0.1227″ and 0.1475″ pitch miniature chain. For 0.1227″ pitch sprockets, which are made of acetal, please ask for 64205K888 and specify number of teeth. For 0.1475″ pitch sprockets, which are made of Type 303 stainless steel, please ask for 6789K888 and specify number of teeth.

For information about sprockets, see page 1040. For ANSI chain, see pages 1032-1035.

Steel Finished-Bore Sprockets for ANSI #50-#100 Roller Chain

With their wide hubs and finished bores, these sprockets are ready to mount to a shaft. All are made of steel, have standard ANSI keyways, and include two set screws. For use with ANSI single-strand chain.

To Order: Please specify bore size (where necessary) from the available bore range listed below. Available bore sizes are: 5/8″, 3/4″, 7/8″, 1″, 1 1/8″, 1 3/16″, 1 1/4″, 1 3/8″, 1 7/16″, 1 1/2″, 1 5/8″, 1 3/4″, 1 15/16″, 2″, 2 3/16″, 2 7/16″, and 2 15/16″.

Sprockets with hardened teeth offer increased wear resistance for longer sprocket service life.

Stainless Steel Finished-Bore Sprockets for ANSI Roller Chain

Made of Types 303 and 304 stainless steel, these corrosion-resistant sprockets have wide hubs and finished bores, which means they are ready to mount to a shaft. They also have standard ANSI keyways and include two set screws. For use with ANSI single-strand chain.

To Order: Please specify bore size (where necessary) from the available bore range listed below. Available bore sizes are: 3/8″, 1/2″, 5/8″, 3/4″, 7/8″, 1″, 1 1/8″, 1 3/16″, 1 1/4″.

Machinable-Bore Double-Strand Sprockets for ANSI Roller Chain

Pair these sprockets with ANSI double-strand chain. All are furnished at the minimum bore size listed below but are machinable up to the maximum bore size. They're made of steel and have hardened teeth for longer sprocket service life.

For the sprocket OD, width, and hub diameter for these sprockets, go to mcmaster.com and search for **2784KAC**.

Machinable-Bore Flat Sprockets for ANSI Roller Chain

Also known as A-plate sprockets, these flat sprockets don't have a protruding hub so they're perfect for confined spaces. All are furnished at the minimum bore size listed below but are machinable up to the maximum bore size. Made of steel. Use with ANSI single-strand chain.

Quick-Grip Screw-Clamp Bushings (see page 1046) and Weld-On Sprocket Hubs (see page 1047) can be used with these sprockets.

For the sprocket OD and width for these sprockets, go to mcmaster.com and search for **2299KAC**.

Machinable-Bore Sprockets for British Standard Metric Roller Chain

For use with ISO single-strand chain, you can machine these sprockets to fit your exact needs. All are furnished at the minimum bore size listed below but are machinable up to the maximum bore size. Made of steel.

Also Available: Sprockets for ISO 04B and 05B roller chain. Please ask for 2302K88 for 04B sprockets; 2302K89 for 05B sprockets. Also specify number of teeth: 12 to 30.

Quick-Disconnect (QD) Bushing-Bore Sprockets for ANSI Roller Chain

These easy-to-install bushing-bore sprockets give you the flexibility to use the same sprocket with different shaft diameters. Simply choose compatible QD bushings (sold separately on this page) with the bore sizes you need. All of these sprockets are made of steel. Use with ANSI single-strand chain.

For the sprocket OD, width, and hub diameter for these sprockets, go to mcmaster.com and search for **62375KAC**.

Quick-Disconnect (QD) Bushings

Use these easy-to-install and remove bushings with quick-disconnect (QD) bushing-bore sprockets (sold separately on this page) and pulleys (see page 1057). Each bushing includes cap screws. As the screws are tightened, the bushing grips the shaft and pulls it into the sprocket or pulley. All bushings are made of steel or ductile iron.

Idler Style—Turn your sprocket into an idler with these convenient bushings. Idler sprockets spin freely to guide and control slack in your chain.

For schematics, additional dimensions, and keyway dimensions for these bushings, go to mcmaster.com and search for **6086KAC**.

Standard Style

To Order: Please specify bore size from those available below. Depending on the bore size you choose, you'll get the corresponding keyway listed below. Bushings with standard ANSI and ISO keyways do not include a key. Bushings with shallow keyways include a key.

Heavy Duty Screw-Clamp Bushings

Count on these high-capacity, carbon steel bushings to handle high torque and thrust loads. When you tighten the included cap screws, the inner sleeve contracts onto the shaft while the outer sleeve expands to hold your component. Match the bushing ID to your shaft diameter; match the bushing OD to the bore of your sprocket, pulley, or gear.

Flanged bushings have a self-centering hub design that makes it easy to center the bushing in your sprocket, gear, or pulley.

Nonflanged bushings offer higher torque ratings.

Flanged

Nonflanged

Quick-Grip Screw-Clamp Bushings

Tighten the collar nut to torque up these bushings in just seconds—they have no keys, cap screws, or other components to slow you down. In addition to being quick and easy to install and remove, these bushings accommodate shafts that are slightly out of round. As you tighten the collar nut, the inner sleeve contracts onto the shaft while the outer sleeve expands to hold your component. Match the bushing ID to your shaft diameter; match the bushing OD to the bore of your sprocket, pulley, or gear.

Taper-Lock Bushing-Bore Sprockets for ANSI Roller Chain

Similar to the quick-disconnect (QD) bushing-bore sprockets on the previous page, except bushings mount flush inside these taper-lock sprockets for added clearance. They give you the flexibility to use the same sprocket with different shaft diameters. Simply choose compatible taper-lock bushings (sold separately on this page) with the bore sizes you need. All are made of steel. Use with ANSI single-strand chain.

ⓘ For the sprocket OD, width, and hub diameter for these sprockets, go to mcmaster.com and search for **2590KAC**.

Taper-Lock Bushings

Easy to install and remove, these bushings fit flush into taper-lock bushing-bore sprockets (sold separately on this page). To install, align the bushing and tighten the two included set screws to the recommended torque. The bushing contracts and wedges inward, gripping the shaft and bore of the component. Bushings have an 8° taper and are made of steel.

Idler Style—Turn your sprocket into an idler with these convenient bushings. Idler sprockets spin freely to guide and control slack in your chain.

Standard Style

To Order: Please specify bore size from those available below. Depending on the bore size you choose, you'll get the corresponding keyway listed below. Bushings with standard ANSI keyways do not include a key. Bushings with shallow keyways include a key.

Light Duty Reducer Bushings

Reduce the bore size of finished bore products such as sprockets, pulleys, and gears. Bushings have a 21/64″ clearance hole so a set screw can secure your part to the shaft and hold the bushing in place. For low-torque applications. Length is 1 1/8″.

Self-Adjusting Spring Keyless Bushings

Slotted-tooth design adjusts for a tight fit against housing bores. Made of spring steel, these bushings resist wear and shock and have chamfered ends for easy installation. All handle oscillating or slow rotational motion up to 14 feet per minute. They work well as a high pressure pivot on hardened shafts and bolts.

Weld-On Sprocket Hubs

Weld these steel hubs to gears, sprockets, or pulleys to create quick-disconnect (QD) or taper-lock sprockets. All of these hubs come drilled, tapped, and taper bored for QD bushings (not included; see page 1045) or taper-lock bushings (not included; see page 1046).

Steel Acme Clamp-On Collars

Easily thread these steel collars to your desired location, then lock in place with the included clamp screw. All are standard travel (single start) and have right-hand threads. Use them with Standard-Travel Precision Acme Threaded Rods (page 1107) and General Purpose Acme Rods (pages 3181-3182). Speed ratio is 1:1.

Noncontact Magnetic Set Screw Shaft Couplings

Transmit torque through air. The two halves (sold separately) of these disc couplings contain strong opposing rare earth magnets. The magnetic force transfers torque from one half to the other through air gaps; there's no contact between parts. Their flat design means no slipping and allows for angular misalignment up to 3° and parallel misalignment up to 1/4″. Couplings are made of 400 series stainless steel; magnets are nickel plated. **To Order:** Please specify bore size from those listed in the table below. Halves are sold separately. Order two of the same OD to form a complete coupling.

Available Bore Sizes	O'all Lg.	OD	Screw Size	Max. rpm	Max. Torque, in.-lbs.		
3/16″, 1/4″, 5/16″	1 3/8″	1 23/32″	8-32	26,000	4	9199T1	$46.20

Friction Torque Limiters and Sprockets

Protect your machinery from torque overload by installing your sprocket or pulley as a center member in these limiters. When overloaded, the center member slips on the limiters' internal friction disc. When the overload stops, the limiters automatically reset. Simply use the adjustment nut to change the spring force to set the torque at which the limiters will slip.

All limiters have an integral, high-grade steel hub and pressure plate; 1/8″ thick friction discs that separate the center member from the hub and pressure plate; a standard ANSI keyway (unless noted; see page 1174 for keyway dimensions); and a set screw. ***Double-spring limiters*** provide a higher maximum torque.

Optional Roller Chain Sprockets—These sprockets are designed to work as center members for the torque limiters described above. They have a hubless plate design and are ground for proper torque release and re-engagement. The limiters have needle bearings for mounting these sprockets (unless noted). *Note:* Sprockets are not interchangeable—they only fit limiters shown on the same line in the listing below.

To Order: For limiters, please specify bore size from the available range below. Available bore sizes are 1/4″, 5/16″, 3/8″, 1/2″, 5/8″, 3/4″, 7/8″, 1″, 1 1/8″, 1 3/16″, 1 1/4″, 1 3/8″, 1 7/16″, 1 1/2″, and 1 5/8″. **To Order:** For sprockets, please specify applicable ANSI chain size: #25, #35, #40, #41, #50, #60, #80, or #100. **Also Available:** Replacement friction discs. Please ask for 6525K1 and specify limiter OD.

■ 3/4″ bore keyway is 3/16″ × 3/64″. ◆ Includes a bushing for mounting sprocket to limiter. ● 7/8″ and 1 3/16″ bore sizes not available.

About Belting, Belts, and Pulleys

Belt drives are a quiet, economical, lube-free, and easy-to-maintain way to transmit power between shafts.

Belting is sold by the foot. You can join the ends of belting to form custom-length belts.

Belts come with the ends joined and are ready to install.

Drive pulleys transmit power to belts in your drive. ***Idler pulleys*** are free wheeling and maintain tension in your belt drive. ***Plain-bore pulleys*** have bores that you can machine to fit your needs. They do not have set screws or keyways. ***Finished-bore pulleys*** fit directly on a shaft and have set screws and/or standard ANSI keyways (for ANSI keyway dimensions, see page 1174). ***Bushing-bore pulleys*** accept QD (quick-disconnect) bushings (see page 1045) and screw-clamp bushings (see pages 1045 and 1046). They generally handle higher horsepower than finished-bore pulleys.

How to Measure Belt Outer Circle (OC)

To determine the correct belt outer circle (OC) for your application, wrap a string around the two pulleys that you want to use with a belt. Then, measure the length of the string. Finally, order a belt that is 10% shorter than the length of the string to allow for belt stretch.

Urethane Round Belting

Quick-Connect Hollow-Core Belting and Belting Connector

Solid-Core and Polyester-Reinforced Solid-Core Belting

This chemical-resistant belting is designed for drives in conveyors and light duty power transmission applications. Join the ends to create any belt length you need. Multiple lengths can be used to replace conventional flat belts. All belting is FDA compliant, except for the metric sizes.

To Order: Please specify length in 1-ft. increments up to a maximum length of 100 ft. (except for 6567K56, which has a maximum length of 200 ft.).

Quick-Connect Hollow-Core Belting and Belting Connectors— Easily make belts without special tools—just cut belting to desired length and join the ends with connectors (sold separately).

Solid-Core Belting— To join ends, use a welding kit (see 62065K41 on page 1065). *Metric belting* has a rough surface. It also provides good water resistance, so it's perfect for washdown applications. *Polyester-reinforced belting* is stronger than regular solid-core belting.

High-Performance Rubber Round Belting

Fluoroelastomer and EPDM

Silicone

When common urethane belting just won't do, look to this high-performance rubber belting. Join the ends to create any belt length you need. Multiple strands can be used to replace conventional flat belts.

To Order: Please specify length in 1-ft. increments.

Fluoroelastomer— The choice for areas with high temperatures (–15° to +400° F) and where oil is used. This belting is also resistant to gasoline, synthetic lubricants, ozone, and UV light. Color is black. To join ends, use adhesive 7569A22 or A24 on page 3411.

Silicone— Extreme temperatures (–65° to +450° F) are no problem for this belting. It also resists detergents, ozone, salt water, and UV light. Color is red/orange. To join ends, use adhesive 74945A69 on page 3417.

EPDM— Great for use in outdoor environments, this belting handles temperatures from –65° to +212° F. It also resists detergents, ozone, salt and fresh water, and UV light. Color is black. To join ends, use adhesive 7569A22 or A24 on page 3411.

Adjustable-Length Round Belting

Install or replace belts in just seconds without taking your drive components apart. Simply use this belting, which allows you to add or remove links with a quick twist of the wrist.

Belting is made of urethane elastomer that's reinforced with polyester fabric. You can use it to replace urethane, rubber, and leather round belts. Color is red.

To Order: Please specify length up to a maximum length of 25 ft.

Coil Spring Round Belting

Belting

Connector

Need to be extra flexible? Choose this easy-to-install coil spring belting. Just cut belting to desired length, thread a connector (sold separately) into each end, and then hook the ends together to create a flexible belt.

Belting— Furnished in 10-ft. lengths.

Connectors— For the carbon steel connectors, package quantity is five.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Leather Round Belting

Made of strong, oak-tanned leather, this belting has some elasticity to prevent excessive permanent stretch. Just cut belting to desired length and join the ends with connectors (made of steel; sold separately) to make a belt. **To Order:** Please specify length: 5, 10, 20, 25, 50, or 100 feet.

***Joining Tool*—**This multipurpose steel tool makes it easy to cut belting, punch holes for connectors, and crimp connectors onto the ends of belting.

Easy-Hook Twisted Urethane Round Belts

Installer Kit

Dia.	Color	5¼"-13¼" Outer Circle		13½"-22¼" Outer Circle	
3/16"	Clear	9285K63	$4.04	9285K64	$5.28
3/16"	Black	9285K65	4.34	9285K66	5.74
Repl. Stainless Steel S-Hook		9285K61	$2.20		
Optional Plastic C-Hook		9285K62	.97		

Furnished with a stainless steel S-hook already assembled onto one end, these twisted belts are quick and easy to install without dismantling your drive shafts. There's no need for adhesives or welding—simply install belts and hook the ends together with the included S-hook or, if you prefer plastic, the optional C-hook that's sold separately.

To Order: Please specify outer circle (OC) in ¼" increments from the available outer circle ranges listed.

***Installer Kit*—**Includes a stainless steel installer tool, plunger-activated claw for threading bolt, and grappler tool for pulling belt loop over hook. Works with steel and plastic belt hooks.

1966K1 ..... $57.61

Round-Belt Pulleys

***(A) UHMW-Polyethylene Plain-Bore Drive Pulleys*—**Made of ultra-high molecular weight polyethylene. USDA and FDA compliant. Great in harsh, wet, and sanitary environments.

***(B) Nylon Bushing-Bore Idler Pulleys*—**These free-wheeling pulleys are made of glass-reinforced nylon for high strength and abrasion resistance. They have a sintered-iron bushing bore, chrome-alloy steel precision bearings, and synthetic rubber seals.

***(C) Brass Plain-Bore Miniature Idler Pulleys*—**Perfect for use in tight spaces. Made of heavy duty nonsparking brass, pulleys have a plain bore with precision ABEC-3 rated, double-shielded stainless steel ball bearings.

Urethane Flat Belting

Use this belting with small-diameter crowned pulleys in motion and conveying systems as well as for light- to medium-torque power transmission applications. This tough, flexible urethane belting is FDA compliant and has a high resistance to abrasion, oil, and many chemicals. Color is orange. To join ends, use a welding kit (see 62065K41 on page 1065).

To Order: Please specify length up to 100 ft.

SBR Rubber Flat Belting

Made of SBR rubber, this belting is suitable for light- to medium-torque power transmission applications. It has a tan SBR friction cover on each side to reduce gouging and cotton/polyester layers in the middle. Width tolerance is ±1/8". To join ends, use Alligator Belt Lacing (see 6118K on page 1065).

To Order: Please specify length.

Flat Belts

High-Performance Urethane

These high-performance belts offer greater flexibility as well as better chemical and abrasion resistance than common urethane belts. FDA and USDA compliant. Color is orange. **To Order:** Please specify outer circle (OC) in 1" increments up to a maximum of 1,200".

Wd.	Thick.	Min. Pulley Dia.		Per Inch

Antistatic Nitrile-Coated Nylon

If you need to limit static electricity discharge, then these are the belts to choose. All are made of NBR-coated nylon fabric. The fabric is coated on both sides so you can drive pulleys on the inside as well as the outside of these belts. For use with crowned or flat-belt pulleys. Color is green and black.

***7"-60" Outer Circle*—To Order:** Please specify outer circle (OC) in 1" increments from 7" to 60".

***7½"-4,140" Outer Circle*—To Order:** Please specify outer circle (OC) in ¼" increments from 7½" to 4,140".

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Leather Flat Belting

Leather is a classic drive-belt material, which offers a good gripping surface and superior oil resistance. To join ends, use Alligator Belt Lacing (see 6118K on page 1065). **To Order:** Please specify length.

***Leather*—**This durable, oak-tanned leather belting provides flexibility and strength. It also has waterproof cement between the layers to ensure adhesion for long service life. Quick-Install Clipper Conveyor Belt Lacing (see page 1256) can also be used to join the ends.

Side-stock belting is for use on lighter duty drives. *Center-stock belting* is cut from the strongest leather and is for use on heavy duty drives.

***Leather with Nylon Core*—**Made of chrome-tanned leather with a nylon core, this belting is stronger than plain leather belting and can handle higher speeds. A skiving process can also be used to join the ends.

Flat-Belt Pulleys

Laminated-Fiber Flat-Belt Pulleys

Also known as paper-plant pulleys, these pulleys are made of laminated fiber, which minimizes belt slippage to increase belt life. All have a finished bore with standard ANSI keyway and set screw (see page 1174 for ANSI keyway dimensions).

To Order: Please specify bore size from the available sizes listed.

Nylon and Cast Iron Flat-Belt Idler Pulleys

All are free-wheeling for excellent belt tensioning.

***Nylon*—**These pulleys are glass-reinforced nylon for high strength and abrasion resistance. They have a sintered-iron bushing bore, chrome-alloy steel precision bearings, and synthetic rubber seals. A molded-in crown centers your flat belt and prevents rubbing against the flanges.

Adjustable-Length V-Belting

Easily add or remove sections. Perfect for making replacement V-belts. **To Order:** Please specify length.

***(1) Twist Lock*—**Simply twist to couple or uncouple this belting. Made of a polyurethane elastomer reinforced with multiple plies of polyester fabric, it transmits the same horsepower as standard V-belts with less vibration. Color is red.

***(2) Grip-Top Twist Lock*—**Just like the twist lock belting above but with a strong, textured PVC top layer for a good gripping surface.

***(3) Adjust-a-Link*—**Connect belting links with the included plated-steel rivets using the installation tool (sold separately below). Links are made of polyester/polyurethane. Color is orange.

***(4) Perforated*—**This heavy, solid-core synthetic rubber belting is fabric reinforced and has equally spaced holes to accommodate connectors (made of steel; sold separately below). Color is black.

Urethane V-Belting

V-Belting

V-Belting with Wing Top

This FDA-compliant solid-urethane belting is highly flexible, yet it maintains tension without the need for springs or idlers. It's extremely durable, quiet running, and grips well. It's also highly resistant to marking, vibration, abrasion, dirt, oil, and chemicals. Great for light to medium duty torque power transmission and conveying. To join ends, use a welding kit (see page 1065). **To Order:** Please specify length.

***V-Belting*—** The *orange belting* is more flexible than the *clear belting.*

***V-Belting with Profile Top*—** Specially shaped tops grip and/or carry objects. Color is orange.

Banded B-Section V-Belts

4 Bands

3 Bands

Banded belts have multiple B-section V-belts (from 2 to 5) that are permanently joined to not only deliver consistent drive but also withstand shock loads better than individual belts. Made of rubber with polyester reinforcing cords, all offer oil and friction resistance. The top width is 21/32″ per band. Color is black.

To Order: Please specify number of bands: 2, 3, 4, or 5.

Urethane V-Belts

Just like the Urethane V-Belting sold separately on this page, except the ends of these belts are already welded together, so they're ready for use. Color is orange.

To Order: Please specify outer circle (OC) in 1″ increments.

Belt Type	Min. Pulley Dia.		Per Inch
3L	1 3/4″	59735K31	$0.56
4L, A	2 1/2″	59735K32	.85
5L, B	3 1/4″	59735K33	1.31
C	4 1/2″	59735K34	2.40

4L, A, 5L, and B V-Belt Pulleys

3.15″ to 6.45″ OD

6.75″ to 18.75″ OD

Specifically designed for light-capacity, fractional-horsepower, Type A (4L and A) and Type B (5L and B) V-belts, these pulleys have a quick-disconnect (QD) bore for easy installation and removal. Use them with Style-H Quick-Disconnect (QD) Bushings (not included; sold separately below). All pulleys are made of cast iron.

Style-H Quick-Disconnect (QD) Bushing 6086K19 $13.60

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

2L, 3L, 4L, and 5L V-Belts

Look to these V-belts to handle your light duty applications, particularly those using fractional-horsepower (less than 1 hp) motors. All are made of molded rubber with polyester reinforcing cords. Color is black.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Matched V-Belts and Superflex V-Belts

Made of molded rubber with polyester reinforcing cords, all of these belts are oil and heat resistant. Color is black.

Matched V-Belts—Use these high-precision belts for drives that require multiple V-belts with highly precise outer circle (OC) lengths. All are matched—the outer circle of a particular trade size will vary no more than ±0.060″ for 26″ to 36″ OC, ±0.070″ for 37″ to 87″ OC, and ±0.080″ for 88″ to 93″ OC. ***Superflex V-Belts***—With four times the side-to-side flexibility of standard V-belts, these belts handle the twisting and turning that is common in curved roller conveyor applications.

Cogged V-Belts

The cogged design (molded-in notches) provides excellent flexibility, which makes these belts perfect for use on small diameter pulleys. Made of EPDM with polyester reinforcing cords, all of these belts are oil and heat resistant. Color is black.

V-Belts for Variable-Speed Pulleys

Specially designed to ride up and down the V-groove of variable-speed pulleys, these belts allow precise speed control and a wide range of speed ratios. Use them with variable-speed drives that require 1922V-Type belts. All are neoprene rubber with polyester reinforcing cords. Color is black.

V-Belt Pulleys

All come furnished with a set screw. **To Order:** Please specify bore size from those available below.

Cast Iron—For Type A (4L, A, and AX) and Type B (5L, B, and BX) V-belts. Pulleys have standard ANSI keyways (except for ½" bore sizes, which have no keyways). See page 1174 for ANSI keyway dimensions. ***Nylon***—Have a glass-reinforced nylon body with aluminum hub (except for the 1" OD pulley, which is all nylon). ***Die Cast Zinc***—Pulleys for 4L and 5L V-belts with ⅝" to 1" bore sizes have standard ANSI keyways. See page 1174 for ANSI keyway dimensions.

♣ 1" bore size has spoked design. ● All sizes have spoked design.

McMASTER-CARR®

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Variable-Pitch and Constant-Tension Finished-Bore V-Belt Pulleys

All of these pulleys include set screws and have standard ANSI keyways (except for 1/2″ bore sizes, which have no keyways). See page 1174 for ANSI keyway dimensions. Pulleys are made of cast iron. **To Order:** Please specify bore size from those available below.

Variable Pitch

You can adjust the pitch of these pulleys to improve the surface contact with your V-belts for more efficient driving and longer life. Adjustments are easy—simply move the sides of the pulleys together and apart on the threaded hub.

Constant Tension

A built-in spring automatically maintains constant belt tension. Pulleys accommodate Type A (4L, A, and AX) and Type B (5L, B, and BX) V-belts, unless noted. Made of cast iron with a nylon bushing.

OD	Min. Pitch Dia.	Max. Pitch Dia.	(X)	(Y)	Available Bore Sizes

● For use with Type B V-belts only.

Step-Cone V-Belt Pulleys

With multiple steps on each pulley, you can change your speed by moving your belt to a different step. Use these pulleys with Type A (4L and A) V-belts on fractional-horsepower (less than 1 hp) motors. They include set screws and have standard ANSI keyways (except for 1/2″ bore sizes, which have no keyways). See page 1174 for ANSI keyway dimensions. Pulleys are made of die cast zinc. **To Order:** Please specify bore size: 1/2″, 5/8″, or 3/4″.

QD Bushing-Bore V-Belt Pulleys

For fast installation and removal, use these pulleys with quick-disconnect (QD) bushings (sold separately, see page 1045).

Pulleys are solid, except for those marked with a ♦, which have a spoked design. All are made of cast iron.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

UHMW Plain-Bore V-Belt Pulleys

Great for harsh, wet, and sanitary environments, these ultra-high molecular weight (UHMW) polyethylene pulleys are USDA approved and FDA compliant. They resist abrasion, corrosion, and chemicals, plus the nonstick surface resists buildup and does not need lubrication.

High-Capacity Narrow Wedge V-Belts and Pulleys

V-Belts

3V

Cogged 3VX

With a deeper and narrower profile than standard V-belts, these belts offer higher horsepower capacity within the same amount of drive space. They ride deeper in the pulleys, resulting in more surface contact. Color is black.

3V and ***5V Belts—***Made of rubber with polyester cords.

Cogged 3VX and ***5VX Belts—***The cogged design (molded-in notches) provides the flexibility and heat dissipation needed for small-diameter pulleys. Belts are made of EPDM with polyester cords, unless noted.

Pulleys

Single Groove

Use these narrow pulleys with the V-belts above. All are made of cast iron with a bushing bore. For fast installation and removal, use quick-disconnect (QD) or screw-clamp bushings (see pages 1045 and 1046).

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Nylon V-Belt Idler Pulleys

These free-wheeling pulleys are perfect for high-speed idler and tensioner applications. All are made of glass-reinforced nylon for high strength and corrosion resistance. They have chrome-alloy steel bearings with a synthetic rubber seal.

Ultra-Flex J-Section V-Belts and Pulleys

With their thin profile and ribbed surface (0.14″ Thick.×0.092″ Wd. ribs), you'll get extreme flexibility as well as the gripping power of multiple V-belts in one belt. These belts also provide more surface contact with pulleys for a greater power capacity than standard V-belts—they can handle speed ratios up to 40:1. All are made of neoprene with polyester reinforcing cords. Color is black.

Pulleys—For use with belts (or multiple belts) that have the same or fewer number of ribs to pulley grooves. Made of cast iron, pulleys are solid. For fast installation and removal, use quick-disconnect (QD) or screw-clamp bushings (see pages 1045 and 1046).

MXL, XL, L, H, and AT10 Series Belting and End Plates

A trapezoidal-tooth profile makes this belting perfect for rack-and-pinion, gear-type linear motion applications. For pulleys, see pages 1062 and 1063. **To Order:** For belting, please specify length.

Urethane Belting—This nonmarking belting runs cleaner than neoprene belting. It has Kevlar reinforcing cords, except for the AT10 trade size, which has steel cords. Color is white. ***Neoprene Belting***—Runs quieter than urethane belting. It has fiberglass reinforcing cords. Color is black. ***End Plates***—For mounting one or both ends of belting to a flat surface. Made of aluminum with four 6.5 mm dia. mounting holes (fasteners not included).

Neoprene Belting

End Plate

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

MXL, XL, L, and H Series Timing Belts

Belts

Double-Sided Belts

These trapezoidal-tooth belts mate with grooves in timing-belt pulleys. For use in a fully synchronized drive system. Color is black, unless otherwise indicated.

Urethane—These nonmarking belts run cleaner and are more chemical resistant than neoprene. ***Neoprene***—Run quieter than urethane. ***High-Temp. Silicone***—Withstand corrosion, chemicals, and temperatures up to 400° F. ***Double-Sided Neoprene***—Have teeth on both sides of the belt so you can snake them around several pulleys in a multiple-pulley system.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

MXL and XL Series Timing-Belt Pulleys with Set-Screw Bore

MXL

XL
With Flange

XL
Without Flange

These small, lightweight pulleys fit your MXL and XL series timing belts. All are flanged (unless noted) and have a finished bore with set screw(s).

Pulleys for MXL (Miniature Extra Light) Series Timing Belts— All are made of anodized aluminum.

Pulleys for XL (Extra Light) Series Timing Belts— *Acetal pulleys* are lighter and more corrosion resistant than the steel pulleys.

Pulleys for MXL (Miniature Extra Light) Series Timing Belts—0.080″ Pitch

L and H Series Timing-Belt Pulleys

With Set-Screw Bore

With Press-Fit Bore

Made of steel, all of these pulleys are flanged and have a plain bore. ***Pulleys with set-screw bore*** come furnished with a set screw.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

L and H Series Timing-Belt Pulleys for use with QD Bushings

For fast installation and removal, use these pulleys with quick-disconnect (QD) bushings (sold separately, see page 1045). All of the pulleys are made of machined steel (unless noted). They are flanged (unless noted) and have a quick-disconnect bushing bore.

Poly Chain Timing Belts and Pulleys

Belt

Pulley

Timing Belts—8 mm Pitch

Strong enough to replace metal chain, these urethane belts are coated with nylon and have carbon fiber cords for exceptional flex as well as fatigue and impact strength. They also run quieter than metal chain. All have a modified curve-tooth profile, which allows you to use narrow pulleys for high load-carrying capacity at low speeds. Color is black.

Trade Size	Outer Circle, mm	No. of Teeth	12 mm Wd.		21 mm Wd.

Pulleys—8 mm Pitch

Use these pulleys with taper-lock bushings (sold separately, see page 1046) for easy installation and removal. They're narrow with small bores for more compact drives. Made of sintered steel, unless noted.

▲ Made of ductile iron.

Tire-Track Timing Belts and Pulleys

Belt

Pulley

Here's a quiet belt-and-pulley system for your high-torque, high-precision operations. The tire-track tooth profile of these belts provides optimum surface-area contact with the pulley (sold separately) for very low noise and superb grip. The unique design also makes the belts self-tracking, so there's no need for flanges on the pulleys.

Timing Belts—8 mm Pitch

All are made of rubber and have Kevlar cords for resistance to flex fatigue, elongation, and shock loads.

Outer Circle, mm	No. of Teeth	16 mm Wd. (Yellow) Trade Size			32 mm Wd. (White) Trade Size

■ Not for use with QD bushings. Machinable to range listed.

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

HTD (High Torque Drive) Timing Belts and Pulleys

Belt

Pulley

The curved-tooth profile allows good surface area contact between these belts and pulleys, giving you high torque capacity, a strong grip, and quiet operation. All are interchangeable with HTD (high torque drive) and Power Grip GT belts and pulleys. The *5 mm pitch belts* and *pulleys* are also interchangeable with HPPD (high performance power drive) belts and pulleys.

Belts— All are black. *5 mm pitch belts* are synthetic rubber with Kevlar cords. *8 mm pitch belts* are neoprene rubber with fiberglass cords.

Pulleys— Unless otherwise indicated, use these pulleys with quick-disconnect (QD) bushings (sold separately, see page 1045). All are steel.

UHMW Polyethylene Belt Guides

Round-Belt Guide without Channel

V-Belt Guide with Channel

Why use a belt guide? They keep your belts tracking straight, minimize friction, reduce noise, and prolong belt life. All are UHMW (ultra-high molecular weight) polyethylene. Color is black.

To Order: Please specify length in 1-ft. increments up to a maximum length of 8 feet.

With Channel— These guides include a channel, which makes them easy to install and replace. The channel is made of galvanized steel, unless noted.

Multipurpose Belt-Tension Testers

A

B

Pocket-sized for your convenience, these testers measure belt tension on timing belts and V-belts.

Style A— Place these testers in the center of your belt with the indicator arm down. Align the sides of the testers parallel to the belt edges. Press slowly on the colored pad until you hear a click; then, remove the testers. Finally, read the tension where the top of the indicator arm intersects the scale.

Style B— To use this tester you must first measure your belt span to determine your belt deflection distance. Then use the tester to apply force to your belt to reach your required deflection. Finally, read the force on the tension scale. Includes O-rings to mark your measurements.

	For Belt Wd.	Tension Range, lbs.		
A	Up to 7/8″	30-150	5913T1	$20.00
A	Up to 2″	100-300	5913T2	20.00
B	_____	0- 35	6160K12	30.46

For information about belting, belts, pulleys, and how to measure belt outer circle (OC), see page 1048.

Pull-Style Belt-Tension Indicators

Check your belt tension with these easy-to-use indicators so you can make adjustments to your belts to lessen vibration, noise, and slippage. Simply depress the handle, insert the hook over your belt, and read the tension on the dial.

For Belt Type	For Belt Wd.	Tension Range, lbs.	Leg Wd.		
V-Belts					
A	1/2″	30-180	3 1/2″	6018K12	$198.29
B	21/32″	60-200	4 1/2″	6018K16	243.27
Timing Belts					
—	1/2″-1″	40-180	3 1/2″	60275K21	385.70

Digital Belt-Tension Indicator

Measure V-belt and timing-belt tension using vibration rather than manual deflection. Just position the indicator above the belt and pluck the belt like a guitar string to create vibration. Then, read the tension on the display.

This highly accurate indicator measures the tension from 0 to 9,990 newtons, 10 to 400 Hz, or 0-2,200 lbs.-force. It operates on four AA batteries (included). Furnished with a tuning fork for calibrating the indicator and a plastic carrying case.

1455T1 ..... $1,286.42

V-Belt Sizer

Quickly determine the size of any belt. This tool measures belt top widths up to 1″ and outer circles up to 100″.

60375K2 ..... $70.63

V-Belt and Pulley Groove Gauges

Measure V-belt cross sections and pulley groove depths to select the correct size belt. You'll get three gauges for belts (covering sizes A-E, 3V, 5V, and 8V belts) and eight gauges for grooves (covering A/B combination grooves). All of the gauges are made of blue plastic and are connected with a ball chain.

1937K33 ..... $11.54

Pocket Parallel-Edge Alignment Laser

Slip this 2 1/4″ Lg. × 3/4″ Wd. × 1 3/4″ Ht. tool into your pocket so it's always on hand to align belts, pulleys, chain, and sprockets. Economical and simple to use, this laser has a machined aluminum surface that is adjusted parallel to the contact surface for precise alignment. Just press the tool against the side of your pulley or sprocket and project the laser along your belt or chain to the cardboard target (included) to see any misalignment. Laser is integrated Class II and has a 630-680 nm wavelength. Tolerance is 0.5 mm per 1 meter. Operates on two 1.5-volt batteries (included). Packed in a nylon pouch.

3273A1 ..... $91.75

Magnetic Laser Alignment Tool

Align pulleys, gears, sprockets, and just about anything ferrous with this aluminum magnetic laser alignment tool. It works with pulleys that have 3″ to 6 ft. diameters and 3″ to 20 ft. spacings. Place the adjustable magnetic targets onto the edge of one pulley and attach the laser line emitter on the edge of the other pulley. The laser light intersects the three targets to visually show any misalignment. Laser is Class II, 635 nm wavelength, accurate to ±0.07°, and 1/16″ wide at 30″ with a 70° spread. Tool includes two belt-tension testers for capacities of 30 to 300 lbs., three adjustable targets, a laser line emitter, and a plastic carrying case with foam inserts. Operates on two AAA batteries (included).

Alignment Tool	2309A46	$924.07
Replacement AAA Battery	65605T71	.79

Heavy Duty Spring-Loaded Tensioners

Automatically maintain belt and chain tension with these tensioners. Idler shafts are required and are sold separately below.

Tensioners—Made of steel, tensioners have an internal spring to provide constant tension. For use in all directions with any 1″ bore idler sprocket, such as 6663K73-6663K78 on page 1040 and 1355K3-1355K6 on page 1051. Mounting fasteners are included.

Idler Shafts—Made of hardened and ground steel. Thread size is 3/4″-16 × 7/8″.

Tensioners

Tension Cap., lbs.	Fits Idler Bore Size		
22	1″	1816K1	$101.66
44	1″	1816K2	103.47

Idler Shafts

2 1/4″	3 1/8″	1″	1816K4	14.30
3 1/4″	4 1/8″	1″	1816K5	16.52

Front and Side View of Tensioner Shown with Idler Shaft

Alligator Belt Lacing Sets

Can be installed with a hammer.

The teeth on the lacing in these sets bite into your belts to easily join flat-belt ends. They provide a tight hold with uniform tension across the width of your belt. Once installed (all you need is a hammer), the joints are flush with the belt surface on both sides, so teeth run smoothly over idlers and won't catch on conveyed products.

Sets include lacing and removable hinge pins, which connect the belt ends. Perfect for flat power transmission belts and other belts up to 12″ wide.

Steel Lacing Sets—For use on most applications.

Type 316 Stainless Steel Lacing Sets—The choice for sanitary applications. They are nonrusting, nonmagnetic, and resist acids and chemicals.

■ Lace numbers for stainless steel have an "S" added to the end.

Welding Kit for Urethane Belting

Everything you need to join urethane round, flat, and V-belting (except E-section V-belting) up to 2″ wide. Kit includes a belt cutter, belt clamp, heating tool with rest, flush-cutting pliers, and a plastic carrying case. To join, cut belting ends for a clean surface, insert into belt clamp, apply heating tool to soften belting ends, join belting ends, let cool, then trim flush.

Heating tool operates on 110/120 VAC and reaches a maximum temperature of 475°F. It has a 2 1/8″ wide nonstick-coated blade, a 5 1/2-ft. power cord with three-prong plug, and is UL listed.

Welding Kit	62065K41	$662.18
Replacement Heating Tool	62065K11	107.80
Replacement Heating Tool Blade	62065K16	28.58
Replacement Flash-Cutting Pliers	62065K12	30.78
Replacement Belt Clamp	62065K13	368.25

Nonslip Belt Coatings

Coat your belts to eliminate slippage, reduce vibration, waterproof, and extend belt life. These coatings do not contain rosin, silicone, or CFCs. Offered in a ***4-oz. nonaerosol bottle*** for precise application and a ***10-oz. aerosol can*** that's great for spraying larger areas.

4-oz. Nonaerosol Bottle	6155K29	$11.88
10-oz. Aerosol Can	6155K27	13.00

About Jaw-Style Pullers

Use a jaw-style puller to remove and install gears, bearings, bushings, wheels, and pulleys. When space allows, select a three-jaw puller for better stability and a more evenly distributed pulling force.

The listed puller capacity should be used as a guide. If you can grip and reach an object, your puller will normally have enough power to pull it. When in doubt, choose the next larger puller size.

Mechanical Pullers

External Jaw Pullers

2-Jaw Style with T-Handle Forcing Screw and Gripping Tips at One End

2-Jaw Style with Hex-Head Forcing Screw and Gripping Tips at Both Ends

3-Jaw Style with Hex-Head Forcing Screw

Combination 2- and 3-Jaw Style with Gripping Tips at Both Ends

Combination 2- and 3-Jaw Style Set

Made of forged steel for strength and durability, these pullers have a carbon steel hex-head forcing screw (except for models 6340K71 and K72, which have a T-handle forcing screw). The jaws have an extra adjustment hole, unless noted, so you can adjust the spread and reach for an optimum grip. *Pullers with gripping tips at both jaw ends* give you two different jaw tip sizes on one jaw.

Combination 2- and 3-jaw pullers can be used as a two-jaw as well as a three-jaw puller for added versatility.

Locking External Jaw Pullers

2-Jaw Style

3-Jaw Style

Designed to eliminate slipping, these pullers have an outside cage design that locks the jaws in place during setup and keeps the jaws aligned when you tighten the forcing screw. Pullers also have a T-handle to open and close the jaws, which have tapered tips for access to tight spots.

The cage assembly is die cut steel with a black powder-coated finish, T-handle is cast iron, jaws are drop-forged steel, and the forcing screw is steel with a hardened tip.

Also Available: Replacement parts. Please ask for 6169K9 and specify forcing screw, pin, jaw head or jaw, puller capacity, and style (two or three jaw).

Sets

External Puller Set— Contains one each of 6169K13, 6169K32, 6169K14, and 6169K16 shown above.

6169K63 ..... **Set** $634.10

Internal/External Puller Set— Contains 6169K32 (shown above), three internal jaws, three additional long jaws, and a 2 1/2-lb. slide hammer. Furnished in a plastic case.

6169K66 ..... **Set** $363.90

Accessories

2 1/2-lb. Slide Hammer— Convert 6169K31, 6169K13, 6169K32, and 6169K14 jaw pullers into slide hammer pullers. Overall length is 23 1/2″.

6169K68 ..... $117.00

For information about jaw-style pullers, see page 1066.

Locking Internal/External Jaw Pullers

One puller does the job of two, conveniently handling both internal and external pulling jobs. To convert from external to internal grip, just loosen the locking screw and reverse the jaws. Pullers are steel with forged alloy steel jaws. The jaws are self-locking to make it easy for one person to position the puller and grip an object. All pullers (except for 3765A52 and A2) have a removable forcing screw tip.

Also Available: Replacement forcing screws and forcing-screw tips. For forcing screws, please ask for 3765A62 and specify thread size and length. For forcing-screw tips, please ask for 3765A1 and specify screw thread size.

Internal

***2 1/2-ton Capacity Puller Set*—**Includes a 2 1/2-ton capacity three-jaw puller (3765A2), three extra jaws, and a 1 1/16-lb. slide hammer, all packed in a metal box.

3765A43 ..... **Set** $196.73

Accessories

***Slide Hammers*—**Convert your jaw puller into a slide hammer puller. Made of steel.

Hammer Weight, lbs.	O'all Lg.	Threaded End	For Puller Cap.		
1 1/16	12 5/8"	3/8"-16	2 1/2 tons	3765A33	$28.02
2 1/8	18 1/16"	5/8"-18	6 to 7 1/2 tons	3765A34	74.08

***Pulling Plate*—**Need a better gripping surface? Attach this steel plate to the object you want to pull and then place the jaws from your puller around the plate. Overall diameter is 3 5/8". Center hole diameter is 1 1/8". Includes four 1/4"-20 × 3/4" long and four 1/4"-28 × 1" long screws for use with tapped holes.

For Puller Capacity

2 1/2 to 12 1/2 tons ..... 3765A35 .... $12.80

Internal Jaw Puller

Also known as a pilot bearing puller, this puller removes press-fit bearings, oil seals, and bushings from flywheels, generators, and other equipment. It has a set of jaws (1/2"-1 1/2" spread, 3/4" reach, 7/16" Wd. × 3/16" Thick. tip size) and a 1 3/4-lb. slide hammer with a 1/2"-20 threaded end. To use, turn the jam nut to spread the jaws. All components are steel. O'all size is 3" Wd. × 19 1/2" Lg. *Note:* Not rated for capacity.

Narrow-Head Assembly

6354K2 ..... **Each** $104.09

***Universal Set*—**Includes the puller and all of the accessories shown below.

6354K9 ..... **Set** $201.58

Accessories—Made of steel.

Narrow-head assembly is for use on 1/2" to 1 3/8" inside diameters. The ***1 3/4-lb. slide hammer*** has a 1/2"-20 threaded end and is 17" long.

	Spread	Reach	Jaw Tip Size, Wd. × Thick.		Each
Extra Jaws	1/2"-2"	1 3/4"	27/64" × 1/4"	6354K7	$14.60
Extra Jaws	7/8"-2 1/8"	1"	5/8" × 1/2"	6354K6	14.60

Narrow-Head Assembly	6354K3	**Each**	$83.08
1 3/4-lb. Slide Hammer	6354K4	**Each**	$45.39

Hub and Fan-Blade Puller

Simply mount this puller to a hub using the three included set screws or use the removable jaws to pull fan blades, blower wheels, and pulleys. The puller can be used on motor shafts up to 5/8" dia. and hubs up to 1 3/4" dia. It includes four removable jaws to handle three-blade as well as four-blade fans. Jaws have a 5 1/2" spread, 2" reach, and 1/4" Wd. × 1" Lg. tip size. Forcing screw is 1/2"-20 × 9" long. Body is high-strength aluminum alloy. Jaws and forcing screw are hardened steel. *Note:* Not rated for capacity.

59765K81 ..... **Each** $62.00

***Set*—**Includes the puller and all of the accessories shown below. Furnished in a plastic case.

59765K89 ..... **Set** $83.65

Accessories

Hub adapter is for use on hubs up to 2 3/4" dia.
Long jaws have a 7 1/4" spread and 3 1/4" reach.

Hub Adapter	59765K85	**Each**	$18.50
Long Jaws (4/set)	59765K87	**Set**	6.50

Bolt-Grip Flange-Style Puller Set

Specially designed flange-style pullers use cap screws to remove objects with tapped holes. Also known as steering wheel and flywheel pullers, the pullers in this set are the choice for pulling jobs requiring two- or three-bolt patterns. Pullers are made of steel. *Note:* Not rated for capacity.

Set includes one small-hole puller (2 5/8" spread/bolt-circle dia.; 3 1/4" reach; 5" long forcing screw) and one large-hole puller (4 5/8" spread/bolt-circle dia.; 3" reach; 5 5/8" long forcing screw) with hex-head and flange-head cap screws (3 of each: 3/8"-16 × 3 1/2" long, 3/8"-24 × 3" long, 5/16"-18 × 3 1/2" long, and 5/16"-24 × 3 1/2" long).

69805A25 ..... **Set** $84.74

Bolt-Grip Bar-Style Pullers

These bolt-grip pullers use cap screws that pass through the crossbar to remove objects with tapped holes. They're ideal for small jobs such as gears, hubs, and pulleys. Reach is variable, based on the length of the cap screws being used. Both are made of steel. *Note:* Not rated for capacity.

The ***1 1/2"-4 1/4" spread puller*** includes two 3/8"-16 × 3" long cap screws. It can also be used with the bearing separator (6342K1) on page 1068.

The ***2"-7 3/4" spread puller*** does not include cap screws; see pages 3134-3159 for cap screws.

1 1/2"-4 1/4" Spread Puller
Cap Screw

Spread	Forcing Screw, Thread Size × Lg.	Max. Cap Screw Size		
1 1/2"-4 1/4"	5/8"-18 × 13"	3/8" dia.	5926A3	$42.42
2" -7 3/4"	3/4"-16 × 11 5/8"	1/2" dia.	5926A4	73.44

Forcing Screws and Accessories

Make your old puller work like new by replacing worn forcing screws. All are steel and have a hex head. **Also Available:** Forcing-screw adapters and protectors (which can also be used with Push-Pullers on page 1068). Please ask for 3762A11 for threaded adapters and specify forcing screw/push-puller leg thread size. Please ask for 59875K1 for step-plate adapters or 6268K1 for shaft protectors and specify OD.

Bolt-Grip Push-Pullers

Push-Puller

Push-Puller Shown with Bearing Separator Attachment

Select one of these push-pullers to install and remove bearings, pulleys, sprockets, and other press-fit parts. When pulling an object, the object must have tapped holes. When pushing an object, use the included leg end caps to protect the threads on the legs. Push-pullers are steel.

Extra legs let you maintain or change the reach of the push-pullers. Each set consists of two steel legs. *Note:* End caps are not included.

Attachments for Push-Pullers

Bearing Separator

V-Belt Pulley

All are made of steel.

Bearing Separators—Have a knifelike edge that gets behind the bearing you're pulling to ensure a better grip. The separator you choose must have a width (B) that is larger than the diameter of the bearing you're pulling. *Note:* These separators can also be used with the two-jaw external pullers listed below and sold on page 1066.

V-Belt Pulleys—Clamp into the V-groove of a pulley for a better grip. The pulley you choose must have a width (B) that is larger than the diameter of the pulley you're pulling.

Bearing Separator/V-Belt Pulley Set—Includes one each of the following attachments listed above: 6342K12, K1, K2, K4, and K7. Furnished in a plastic case.

6342K22 ..... **Set** $390.43

Internal/External Bar-Style Pullers

5-Ton Capacity Set

Whether you choose the set or use the individual components to create your own tool, these pullers are great for internal and external gear-pulling jobs. A complete puller consists of a cross-bar with forcing screw and a set of jaws. The crossbar includes two jaw-mounting screws. The jaws slide in slots on the crossbar to adjust the spread. All components are made of forged steel.

5-Ton Capacity Set—Includes one crossbar with forcing screw, two jaw-mounting screws, and one set each of 6337K13, K14, K16, and K15 (shown below).

6337K1 ..... **Set** $564.91

Internal/External Puller Set

This 5- to 7-ton capacity set includes the following steel components:

External Jaw-Style Pullers
- 2 jaw: 6″ spread; 5½″ reach; 5-ton capacity
- 2 jaw: 9″ spread; 5″ reach; 7-ton capacity
- Combo 2 and 3 jaw: 11″ spread; 8¾″ reach; 7-ton cap.

27″ Long Slide-Hammer Reversible-Jaw Puller
- 3 jaw: 1½″-4¼″ internal spread; 1½″-4½″ external spread; 3¾″ reach; 5-lb. hammer
- Puller head (converts 3-jaw puller to 2-jaw)

20″ Long Slide-Hammer Internal Puller
- 2 jaw: ⅞″-2⅛″ spread; 1″ reach

Bridge-Style Internal Puller
- 2 jaw: ⅞″-2″ spread; 1″ reach

Bar-Style Pullers
- 1½″-4¼″ spread; 5½″ reach (forcing screw lg.)
- 2″-7¾″ spread; 11⅝″ reach (forcing screw lg.)

Bolt-Grip Puller
- 1½″-4⅝″ spread/bolt-circle dia.; ⅜″-24×3″ long screws, ⅜″-16×3″ long screws

Bearing Separator Attachments
- ⅛″-2″ spread; 2 7/16″ width
- ½″-4⅝″ spread; 4⅜″ width

6349K42 ..... **Set** $729.08

Expanding Collet Pullers

Set

Here are the internal pullers you need to remove bearings, bushings, and sleeves from holes that don't go all the way through (blind holes). Place a collet through the bore of the object being pulled; then use an actuator pin to expand the collet for a tight grip. Apply pulling force with the slide hammer or bridge with forcing screw. Order individual components or choose the complete set. All components are steel. *Note:* Not rated for capacity.

Collets—*Actuator pin is required.*

Set

You'll get one of each collet, actuator pin, and accessory listed above. Furnished in a steel case.

5991K21 ..... **Set** $950.32

McMASTER-CARR®

For information about jaw-style pullers, see page 1066.

Internal/External Puller Set with Locking Storage Box

For convenience and security, this puller set is furnished in a rugged, lockable storage box (includes lock and two keys). The storage box measures 25¾″ Ht.×29½″ Wd.×10″ Dp. and made of 20-ga. steel.

Set contains the following components, each made of steel:

External Jaw-Style Pullers
- Combo 2 and 3 jaw: 7″ spread; 3¼″ reach; 5-ton capacity
- Combo 2 and 3 jaw: 10½″ spread; 5″ reach; 7-ton capacity
- Set of three long-reach jaws for 5-ton puller
- Set of three long-reach jaws for 7-ton puller

27″ Long Slide-Hammer Reversible-Jaw Pullers
- 2 jaw: 1¼″-3½″ internal spread; 1″-4½″ external spread; 3⁵⁄₁₆″ reach; 5-lb. sliding hammer
- 3 jaw: 1½″-4¼″ internal spread; 1½″-4½″ external spread; 3⁵⁄₁₆″ reach; 5-lb. sliding hammer

19¼″ Long Slide-Hammer Internal Puller
- 2 jaw: ½″-1½″ spread; ¾″ reach

Bar-Style Pullers
- 1½″-4¼″ spread; 3¾″ reach (forcing screw length)

Bolt-Grip Puller
- 4⅝″ spread/bolt-circle dia.; ⅝″-18×5⅝″ long screws

Bearing Separator Attachments
- ⅛″-2″ spread; 2⁷⁄₁₆″ width
- ½″-4⅝″ spread; 4⅜″ width

69715A44 ..... **Set** $1,112.19

Hydraulic Puller Sets

17½-Ton Set

Difficult operations are made easier with hydraulic pulling force. All components are made of steel.

17½-Ton Capacity Puller Set

You'll get a 3-jaw external puller (20″ spread; 11½″ reach), puller head (converts 3-jaw puller to 2-jaw puller), hydraulic cylinder with 2″ piston stroke, push-puller with end caps (5¾″-11¾″ spread; 16½″ reach without end cap and 18½″ with end cap), pair of extra legs (no end caps) for push-puller (22½″ reach), 1″-8 female×⅝″-18 male threaded adapter, ⅝″-18 female×¾″-16 female threaded adapter, bearing separator attachment (½″-9″ spread; 9½″ width), internal jaw attachment (1½″-9″ spread; 4″ reach), two pushing adapters, adjusting screw, and crank handle. Furnished in a wood case.

6315K73 ..... **Set** $2,428.57

Hydraulic Pump Accessory Set

Includes everything you need to connect your hydraulic pump to a puller. Use with your own pump or see pages 1387-1388 for hydraulic pumps. Set contains a pressure gauge with four scales (0-15,000 psi); 6-ft. long hydraulic hose; ¼″ NPT female×¼″ NPT male 45° fitting; ⅜″ NPT female hose coupler; and a tee adapter with ¼″ NPT female, ⅜″ NPT female, and ⅜″ NPT male ports.

6315K79 ..... **Set** $265.87

Internal/External Slide-Hammer Puller

Handle internal and external pulling jobs such as gears, bearings, and oil seals. Order the slide-hammer puller and components individually or choose the complete set. All of the components are steel. *Note:* Not rated for capacity.

Slide-Hammer Reversible-Jaw Puller

You supply the pulling force by sliding the hammer along the rod. Puller is 27″ long and can be assembled with two or three jaws. Internal spread is 1¼″-3½″ for a 2-jaw puller; 1½″-4¼″ for a 3-jaw puller. External spread is 1″-4½″ for a 2-jaw puller; 1½″-4½″ for a 3-jaw puller. This puller has a 2½-lb. slide hammer that can be removed from the rod and used independently.

6317K8 ..... $105.39

Accessories

2-Jaw Puller Bar— Converts a 3-jaw puller to a 2-jaw puller. Has a ⅝″-18 center hole.

6317K5 ..... **Each** $11.53

Crossbar— Pulls objects that have tapped holes. Has a ⅝″-18 center hole for use with ⅜″ dia. cap screws (not incl.). Spread is 1⅞″-5⅝″.

6317K6 ..... **Each** $25.95

		Each
2½-lb. Slide Hammer (⅝″-18 threaded end)	**6317K1**	$43.75
Locking 3-Jaw Puller	**6317K4**	58.58
Oil-Seal Puller Hook (for minimum ¾″ ID)	**6317K7**	10.58
Forcing Screw (⅝″-18×5½″ long)	**6317K31**	8.95

Jaws— For internal and external pulling jobs (except for 6317K14, which are known as pilot bearing jaws and are for internal jobs only).

Internal Spread	External Spread	Reach		Each
1″ -2¾″	_____	2⁵⁄₁₆″	**6317K14**	$3.65

3¼″-6¼″	1″ -6¼″	6½″	**6317K13**	3.98

Set

You'll get the slide-hammer puller; crossbar; locking 3-jaw puller; oil-seal puller hook; and jaws 6317K12, K13, and K14 all shown above.

6317K34 ..... **Set** $257.22

Bearing and Seal Driver Sets

Basic Set

Deluxe Set

When used with a mallet or hammer, the interchangeable handles and discs form custom driving tools for installing different size bearings and seals. The ***deluxe set*** can also be used for installing bushings.

Basic Set— Includes a handle and six discs in 1.565″ OD, 1.75″ OD, 1.965″ OD, 2.325″ OD, 2.47″ OD, and 2.555″ OD sizes. The discs have a tapered side for installing bearings and a flat side for installing seals. The handle and discs are made of aluminum.

57195K81 ..... $40.98

Deluxe Set— Includes two handles and 41 discs ranging from ½″ through 3″ OD in ¹⁄₁₆″ increments. Get even distribution of force by combining the discs—use one small disc as a pilot and a larger disc as a driver. Insert another disc between the pilot and driver to add space. The handle and discs are made of steel. Furnished in a plastic case.

6053K11 ..... $514.05

Stainless Steel Ratchets and Pawl

To prevent reverse motion while allowing forward motion, use one of these ratchets with a pawl (sold separately) on braking systems and rotating equipment.

Ratchets have sloped teeth and press fit onto a shaft. Made of Type 303 stainless steel. ***Pawl*** has a hooked end that fits into the teeth on a ratchet. Made of Type 17-4 PH stainless steel.

Pawl					**6283K32**	43.86

14 1/2° Pressure Angle Spur Gears

About Gears

To work together, gears must have the same ***pitch*** and ***pressure angle*** (the angle between contact points of meshing teeth). A gear's pitch is its number of teeth divided by its pitch diameter. For example, a gear with 16 teeth and a pitch diameter of 1/2″ will have a pitch of 32. For higher load capacities, choose 20° pressure angle gears over 14 1/2° gears.

Below you will find gauges to measure gear pitch and pressure angle. See page 2264 for additional information.

14 1/2° Pressure Angle Gauge Set	2069A67	$51.95
14 1/2° and 20° Pressure Angle Gauge Set	2069A12	$167.71

Steel Plain-Bore 14 1/2° Pressure Angle Spur Gears and Racks

Gear on Rack

Spur Gears— Have a plain bore furnished in the minimum size listed and are machinable up to the maximum size listed. Made of 1144 steel. ***Gear Racks*** and ***Ready-Mount Gear Racks—*** All are made of C1018 steel.

Note: Choose spur gears and racks with the same pressure angle and pitch. The 14 1/2° and 20° pressure angle spur gears and racks are not compatible.

Ready-Mount Gear Racks

No machining needed; counterbored mounting holes are already in place to save you time. All of these racks are 4 ft. long with 12 mounting holes spaced 4″ apart, starting 2″ in from each end. Mounting screws not included.

Pitch	Face Wd.	O'all Ht.	Screw Size		
24	1/4″	1/4″	#0	5170T1	$55.52

12	3/4″	3/4″	1/4″	5170T4	86.15

For information about gears, see page 1070.

Steel Finished-Bore 14 1/2° Pressure Angle Spur Gears

Furnished ready to use, these steel gears provide a high contact ratio for lower backlash and smoother, quieter operation than 20° pressure angle gears. All include a set screw and have a standard ANSI keyway, unless noted (see page 1174 for keyway dimensions). *Note:* Use with the gear racks on page 1070 (choose gear racks with the same pressure angle and pitch as your gear). The 14 1/2° and 20° pressure angle spur gears and racks are not compatible.

Molded Nylon Plain Bore 14 1/2° Pressure Angle Spur Gears and Racks

Look to these molded nylon spur gears and racks for light duty applications that don't require close tolerances. All gears have a plain bore without set screws or keyways, unless noted. They are also compatible with metal gear racks. *Note:* Choose spur gears and racks with the same pressure angle and pitch. The 14 1/2° and 20° pressure angle spur gears and racks are not compatible.

Spur Gears—Color is off-white.

14 1/2° & 20° Pressure Angle Spur Gears

For information about gears, see page 1070.

Machined Nylon Plain Bore 14 1/2° Pressure Angle Spur Gears and Racks

Gear on Rack

FDA and USDA compliant, these gears and racks are made of oil-filled machined nylon. They are quiet, lightweight, long-lasting, and corrosion resistant. They're also stronger than molded nylon gears and racks.

Spur Gears—Have a plain bore furnished in the minimum size listed and are machinable up to the maximum size listed. ***Gear Racks***—Furnished longer than the length listed to allow room for finishing the ends.

Note: Choose spur gears and racks with the same pressure angle and pitch. The 14 1/2° and 20° pressure angle spur gears and racks are not compatible.

Spur Gears—Color is off-white.

20° Pressure Angle Spur Gears and Racks

Gear on Rack

When higher load capacities are required, choose these 20° pressure angle spur gears and racks over 14 1/2° spur gears and racks.

Steel and ***Brass Spur Gears***—Have a plain bore. ***Stainless Steel Spur Gears***—Offer superior corrosion resistance and have a finished bore with a set screw.

Note: Choose spur gears and racks with the same pressure angle and pitch. The 14 1/2° and 20° pressure angle spur gears and racks are not compatible.

For information about gears, see page 1070.

Steel 20° Pressure Angle Spur Gear Rods

Make your own spur gears from our steel gear stock, which has been cold rolled for strength. The teeth are already formed so you can easily machine custom face widths and bore sizes. Rods have a polished finish. Furnished in 1-ft. lengths.

Note: Choose spur gears and racks with the same pressure angle and pitch. The 14½° and 20° pressure angle spur gears and racks are not compatible.

14½° Pressure Angle Worm Gears and Worms

Designed for use on 90° angle parallel shafts, these worm gears and worms produce a high speed-reduction ratio in a minimal amount of space. Speed-reduction ratio is determined by the number of teeth. For example, a 20-tooth worm gear and its mating worm will give you a 20:1 ratio and will reduce 200 rpm to 10 rpm.

Worm Gears— All are cast iron and have a plain bore. ***Worms—*** Made of steel, these worms have right-hand threads and a standard ANSI keyway (see page 1174 for keyway dimensions).

20° Pressure Angle Miter Gears

Miter gears transmit motion and power at a 1:1 ratio between shafts that intersect at right angles. To mesh properly, they must be positioned at right angles and have the same pressure angle, pitch, and number of teeth. ***Molded nylon gears*** are lightweight, quiet, and corrosion resistant. ***Hardened steel spiral gears*** offer quieter operation, higher speeds, and greater torque than the nonspiral gears. *Molded nylon* and *steel miter gears* are sold individually; use two gears together to create a set. *Hardened steel miter gears* are sold in sets of two.

Choose miter gears with a ***plain bore*** or with a ***finished bore***. Gears with a ***finished bore*** are ready to mount and include a set screw and standard ANSI keyway (see page 1174 for keyway dimensions).

About Shafts

When selecting a shaft, diameter and straightness tolerances are characteristics to consider. Tighter tolerances ensure uniform distribution of loads and improve accuracy and repeatability. The straighter your shafts are, the smoother your system will operate.

Hardened Shafts

The choice for linear motion applications, hardened shafts are used with linear ball bearings and linear sleeve bearings. All of our hardened shafts have micron finishes that are ideal for linear bearings, slides, and other precision applications. A shaft's finish affects frictional resistance and smoothness of travel as well as the efficiency and life of linear bearings. The lower the micron value, the smoother the finish.

Case hardness is a heat-treating process to harden the outside surface (the case) of shafts. Since bearings travel directly on shafts, they cause shafts to wear. Harder shafts provide more wear resistance. The higher the case value, the harder the shaft.

Drive Shafts

Designed for rotary motion applications, drive shafts are often used with gears, sprockets, and other power transmission components. They can also be used with rotary bearings. Many of these shafts have ANSI keyways for a secure hold in higher-torque applications. Most often, these shafts are not hardened, so they're easier to machine than hardened shafts.

Hardened Shafts

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Hardened Shafts

Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. They have a 9 rms micron finish (unless noted) for inch sizes; 12 rms micron finish (unless noted) for metric sizes. Straightness tolerance is 0.002″ per foot for inch sizes; 0.03 mm per 300 mm (unless noted) for metric sizes. Ends are beveled.

For shaft supports, see page 1086.

For information about the minimum hardness depth of shafts, go to mcmaster.com and search for **6061KAC.**

Shaft Dia.	Dia. Tolerance
1/8″-3/16″	–0.0002″ to –0.0005″
1/4″-1 1/4″, 1 3/4″	–0.0005″ to –0.001″
1 1/2″	–0.0006″ to –0.0011″
2″	–0.0006″ to –0.0013″

Shaft Dia.	Dia. Tolerance
3 mm	–0.002 to –0.008 mm
4-6 mm	0.000 to –0.008 mm
8-10 mm	0.000 to –0.009 mm
12, 15, 16 mm	0.000 to –0.011 mm
13 mm	–0.006 to –0.017 mm
20-30 mm	0.000 to –0.013 mm
35-50 mm	0.000 to –0.016 mm

Inch Sizes—Steel

Shafts are 1566 steel; they're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60.

Hardened Shafts *(Continued from previous page)*

Inch Sizes—Chrome-Plated Steel

Shafts are 1566 steel with a 0.00005″ thick chrome plating that adds some corrosion resistance. Case hardness is Rockwell C60.

■ Shaft has a 10-16 rms micron finish; Rockwell hardness is C56-C58. ▲Shaft has a 10-16 rms micron finish; Rockwell hardness is C52-C56.

Metric Sizes—Steel

Shafts are 1055 steel (except 3 mm and 13 mm Dia. shafts are 52100 steel and have a straightness tolerance of 0.025 to 0.050 mm per 300 mm). They're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C59-C65.

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Miniature Hardened Shafts

With their small diameters, miniature shafts are suited for miniature linear motion applications. Shafts are made of through-hardened 17-4 PH stainless steel for excellent corrosion resistance and good strength. All have a 10 rms microinch finish. Rockwell hardness is C40. Ends are beveled.

Shaft Dia.	Dia. Tolerance	Straightness Tolerance
1/32″-1/4″	0.0″ to –0.0002″	0.0048″ per foot
5/16″, 3/8″	0.0″ to –0.0002″	0.0072″ per foot
1-4 mm	0.0 to –0.005 mm	3 mm per 300 mm

Aluminum Shafts

Move loads in corrosive environments. These Alloy 6061 aluminum shafts are strong, lightweight, and nonmagnetic. Surface hardness is Rockwell C70. Ends are beveled.

Anodized Aluminum Shafts— A 0.002″ thick anodized layer resists chipping. All have a 10-16 rms micron finish. Straightness tolerance is 0.004″ per foot.

Ceramic-Coated Aluminum Shafts— A 0.002″ thick ceramic coating keeps weld splatter, molten glass, and paint from sticking to these shafts. All meet MIL-A-8625 and have a maximum 20 rms micron finish. Straightness tolerance is 0.001″ per foot. *Note:* Ceramic-coated aluminum shafts are not intended for use with linear ball bearings.

Hardened Shafts with Machinable Ends

Machining a custom end for mounting is easier because 2″ of each end has been annealed (softened). Shafts are case hardened and precision ground with exacting diameter and straightness tolerances. The nonannealed portion has a 9 rms micron finish. Shafts are 1566 steel for high strength. Case hardness is Rockwell C60. Straightness tolerance is 0.001″ per foot. Ends are beveled.

Note: The annealed (softened) ends are not intended for linear travel.

Shaft Dia.	Dia. Tolerance
1/4″-1″	–0.0005″ to –0.001″
1 1/2″	–0.0006″ to –0.0011″

For information about the minimum hardness depth of shafts, go to mcmaster.com and search for **6061KAC.**

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Hardened Shafts with Tapped Ends

To save time and avoid the hassle of machining, the shaft ends come internally tapped. Shafts are case hardened and precision ground with exacting diameter and straightness tolerances. All have a 10-16 rms micron finish. Straightness tolerance is 0.001″ to 0.002″ per foot. Ends are beveled.

Steel Shafts— Made of 52100 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60-C64.

Stainless Steel Shafts— These Type 440C stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Case hardness is Rockwell C56-C58.

Hardened Shafts with Threaded Ends

Externally threaded ends have been machined for you—just mount these ready-to-use shafts through a through-hole and secure with a nut. Made of 52100 steel, all are case hardened and precision ground with exacting diameter and straightness tolerances. Shafts have a 10-16 rms micron finish. Case hardness is Rockwell C60-C64. Straightness tolerance is 0.001″ to 0.002″ per foot. Ends are beveled.

Shaft Dia.	Dia. Tolerance
3/8″	–0.0002″ to –0.0006″
1/2″, 5/8″	–0.0002″ to –0.0007″
3/4″, 1″	–0.0003″ to –0.0008″

With One Threaded End

With Two Threaded Ends

Tubular Shafts

Shaft

Shaft Shown with Bearing and Wiring (Not Included)

Lighter than solid shafts, tubular shafts reduce your total system weight and allow you to run various media such as electrical wiring, compressed air tubing, coolants, or lubricants through the center. Shafts are precision ground for tight diameter and straightness tolerances. Ends are beveled.

Inch Sizes—*Hardened shafts* are made of 52100 steel with an unfinished interior. All have a 9 rms micron finished OD. Case hardness is Rockwell C58. ID tolerance is ±5%. Straightness tolerance is 0.001″ per foot.

Unhardened shafts are made of 1026 steel with a finished interior. They come with material certification that includes a traceable lot number and physical test report. Shaft OD has a 32 rms micron finish; ID has a 20 rms micron finish. Hardness is Brinell 225. ID tolerance is 0.003″. Straightness tolerance is 0.003″ per foot.

Metric Sizes—Made of 1055 steel, these shafts are hardened with an unfinished interior. All have a 12 rms micron finished OD. Case hardness is Rockwell C59-C65. ID tolerance is ±4%. Straightness tolerance is 0.1 mm per 1,000 mm.

For information about the minimum hardness depth of the hardened shafts, go to mcmaster.com and search for **6061KAC.**

Hardened Shafts with Support Rail

Get shafts and support rails in one easy-to-install unit. Each consists of a Hardened Precision Shaft with Tapped Mounting Holes (6499K or 6526K on page 1079) mounted on an aluminum alloy support rail.

Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. Ends are beveled. *Inch sizes* have a 9 rms micron finish. Straightness tolerance is 0.001″ per foot. *Metric sizes* have a 12 rms micron finish. Straightness tolerance is 0.025 mm per 300 mm.

Use with open-style linear bearings (see pages 1087-1095).

Steel Shafts—Made of steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60.

Stainless Steel Shafts—These Type 440C stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Case hardness is Rockwell C50-C55.

For information about the minimum hardness depth of shafts, go to mcmaster.com and search for **6061KAC.**

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Ceramic-Coated Aluminum Shafts with Support Rail

A minimum 0.002″ thick ceramic coating keeps weld splatter, paint, and other contaminants from sticking to the shafts. Made of Alloy 6063-T6 aluminum, these shafts and integral support rail are lightweight, nonmagnetic, and have excellent corrosion resistance. Their one-piece design reduces vibration and assembly time. Ends are beveled.

All of these shafts meet MIL-A-8625 and have a maximum 20 rms micron finish. Rockwell hardness is C70. Straightness tolerance is 0.001″ per foot.

Use with open-style linear sleeve bearings (see pages 1092-1095).

Note: Shafts are not intended for use with linear ball bearings.

★ With only one mounting hole on each side, (F) dimension does not apply.

Hardened Shafts with Tapped Mounting Holes

The tapped holes on these shafts match the Support Rails for Hardened Shafts with Tapped Mounting Holes. Shafts are case hardened and precision ground for exacting diameter and straightness tolerances. All have a 9 rms micron finish. Ends are beveled. Straightness tolerance is 0.001″ per foot.

Steel Shafts— Shafts are 1566 steel; they're stronger than stainless steel shafts but are less corrosion resistant. Case hardness is Rockwell C60. Attach shaft to rail from beneath using socket-head cap screws on page 3105.

Stainless Steel Shafts— These Type 440C stainless steel shafts have good corrosion resistance, but are not as strong as steel shafts. Case hardness is Rockwell C50-C55. Attach shaft to rail from beneath using socket-head cap screws on page 3112.

Support Rails for Hardened Shafts with Tapped Mounting Holes

Support rails provide stability over an entire length of shaft, allow unlimited travel lengths, and eliminate bending under moderate to heavy loads. All of these rails are made of lightweight aluminum and are designed for use with open-style linear bearings (see pages 1087-1095). Cut to size or mount end-to-end to make longer lengths. Mounting holes (screws not included) match the Hardened Shafts with Tapped Mounting Holes.

Standard Support Rails— Made of Alloy 6061-T6 aluminum.

Low-Profile Support Rails— Made of Alloy 6063-T6 aluminum.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Drive Shafts

Steel Shafts— Made of 1566 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. They are unhardened for easier machining. Rockwell hardness is C25. Ends are beveled.

Coated Steel Shafts— Made of 1045 steel, these coated shafts are stronger than stainless steel shafts but are less corrosion resistant.

Black-oxide coated shafts have a black-oxide coating for more corrosion resistance than uncoated steel shafts. Rockwell hardness is C20-C30.

Chrome-plated shafts have a 0.0001″-0.0005″ thick chrome plating for more corrosion resistance than black-oxide coated shafts. The *1/4″ and 3/8″ dia. shafts* have a surface hardness that is Rockwell C60-C65. The *1/2″ to 2″ dia. shafts* have a surface hardness that is Rockwell C68-C72.

Nitride-coated shafts have a 0.001″ thick nitride coating for more corrosion resistance than black-oxide coated shafts and chrome-plated shafts. Surface hardness is Rockwell C60-C65.

Type 303 Stainless Steel Shafts— Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83. Ends are beveled.

Type 316 Stainless Steel Shafts— Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is C20. Ends are beveled. *Note:* Not for use with ball bearings.

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Miniature Drive Shafts

Diameters are sized for miniature rotary applications. These shafts also work well with miniature sprockets, pulleys, and gears. Ends are beveled.

Steel Shafts— Made of 12L14 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 167.

Type 303 Stainless Steel Shafts— Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Type 316 Stainless Steel Shafts— Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Fully Keyed Drive Shafts

For a secure hold in higher-torque applications, an ANSI keyway runs the entire length of the shaft (keys not included; see pages 3361-3363). Straightness tolerance is 0.012″ per foot for inch sizes and 0.0305 mm per 300 mm for metric sizes. Ends are beveled.

Steel Shafts— Made of 1045 steel, these shafts are stronger than stainless steel and aluminum shafts but are less corrosion resistant. Rockwell hardness is B95.

Type 304 Stainless Steel Shafts— Have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B85.

Type 316 Stainless Steel Shafts— Have excellent corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B85.

Aluminum Shafts— Made of Alloy 2024-T4 aluminum, these shafts are lightweight and have more corrosion resistance than steel shafts. Hardness is Brinell 120.

Keyed Drive Shafts

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Fully Keyed Precision Drive Shafts with Certification

In addition to diameter tolerances that are twice as tight as the Fully Keyed Drive Shafts, these ultra-straight shafts include a traceable lot number and physical test report. An ANSI keyway runs the entire length of the shaft for a secure hold in higher-torque applications (keys not included; see pages 3361-3363).

Shafts are 1045 steel. Hardness is Rockwell C14-C28. Straightness tolerance is 0.003″ per foot. Ends are beveled.

Partially Keyed Drive Shafts

Shown with Included Key

With a 4″ long ANSI keyway on one end and a 14″ long ANSI keyway on the other, keys won't slide out of position during assembly and operation. All include one 2″ long key and one 4″ long key. Ends are beveled.

Steel Shafts—Made of 1117 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 156. Straightness tolerance is 0.01″ per foot.

Stainless Steel Shafts—These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Hardness is Rockwell B80. Straightness tolerance is 0.003″ per foot.

Shafts with Retaining Ring Grooves

Multiple grooves (four or five on one end; two on the other) allow mounting flexibility, positioning bearings in a fixed spot, and using these shafts as an axle. All are Type 303 stainless steel and have good corrosion resistance. Hardness is Rockwell B83. Straightness tolerance is 0.0008″ per inch. Ends are beveled. For retaining rings (not included), see page 3274.

For information about shafts, see page 1074.

Don't see the shafts you need? Just tell us what you're looking for and we'll get it for you.

Dual-Diameter Shafts

For mounting and connecting flexibility, each shaft has two different diameters. Choose from shafts that step down on one or both ends. Straightness tolerance is 0.003″ per foot. Ends are beveled.

Steel Shafts— Made of 1045 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Hardness is Brinell 150.

Stainless Steel Shafts— These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Hardness is Brinell 160.

Idler Shafts

Count on our specially designed shafts to hold your bearings in idler applications. All shafts are made of steel. For idler rollers, see pages 1121-1122.

Thread-Mount Shafts— Mount in a tapped hole. A retaining-ring groove with included retaining ring and spacers position your bearing.

Flange-Mount Shafts— For a more secure hold, these shafts include washers and a nut to position your bearing.

D-Profile Shafts

Looking for a secure connection when working with set screws? A D-shaped profile provides a flat surface area, which allows set screws to dig into the shaft. The flat surface width is equal to 50% of the diameter size. Diameter tolerance is 0″ to –0.003″. Straightness tolerance is 0.012″ per foot. Ends are beveled.

Steel Shafts with Solid Ends— Made of 1045 steel, these shafts are stronger than stainless steel shafts but are less corrosion resistant. Rockwell hardness is B90.

Stainless Steel Shafts with Solid Ends— These Type 303 stainless steel shafts have good corrosion resistance but are not as strong as steel shafts. Rockwell hardness is B83.

Steel Shafts with One Tapped End— Just like the steel shafts with solid ends but with an internally tapped end.

Shaft Supports

Base Mount, Inch and Metric Sizes

Quick-Access Base Mount

Flange Mount, Inch Sizes

Flange Mount, Metric Sizes

Quick-Access Flange Mount

Brace the ends of your linear shafts when working with light to medium loads where shaft alignment is not critical. For use with closed linear bearings.

Base Mount— Tolerance for (D) dimension is ±0.002″ for inch sizes and ±0.02 mm for metric sizes.

Quick-Access Base Mount— Innovative two-piece design lets you quickly remove the top of the support for access to your shaft. Tolerance for (D) dimension is ±0.003″.

Flange Mount— *Inch sizes* have a four-bolt design. *Metric sizes* have a two-bolt design.

Quick-Access Flange Mount— Innovative two-piece design lets you quickly remove the top of the support for access to your shaft. All have a four-bolt design.

Combination Linear/Drive Ball Bearings and Spline Shafts

Standard Bearing

Flanged Bearing

Spline Shaft

Pair a ball bearing with an end-supported spline shaft to transmit rotary torque while allowing the bearing to move linearly along the shaft. Also called ball splines, these ball bearings and spline shafts offer low friction and low backlash. Torque capacity is the maximum rotational load a bearing can withstand without deforming.

All bearings are closed style and can be mounted in any position without affecting load capacity. They also have a fixed-alignment design and are for use where shaft misalignment is unlikely. Shell and balls are steel. Maximum temperature is 176° F. *Note:* Bearings will only fit the spline shaft listed on the same line in the table.

About Linear Bearings

Linear Ball Bearings (pages 1087-1092)— The choice for smooth linear motion in debris-free environments. Compared to linear sleeve bearings, they require less force to operate because they create less friction. They also run at higher speeds. Linear ball bearings are for use on hardened shafts. They usually require lubrication.

Linear Sleeve Bearings (pages 1092-1095)— Select linear sleeve bearings for heavy loads and when working in dirty environments. They consist of a shell lined with Frelon, PTFE, Rulon, or ceramic. They do not require lubrication, except for bearings with ceramic. Use with hardened or unhardened shafts. To check if a given sleeve bearing will handle your load and speed, calculate the PV (pressure × velocity) value for your application. PV and velocity should not exceed the values listed.

$$\text{PV} = \frac{\text{Static Load (lbs.)}}{\text{Bearing Lg. (in.)} \times \text{Shaft Dia. (in.)}} \times \text{Velocity (fpm)}$$

Parallel-Shaft Applications for Linear Sleeve Bearings— For best results in this common setup, use a *fixed-alignment bearing* on one shaft and a *self-aligning bearing*, which accommodates minor shaft misalignment, on the other.

For technical drawings and 3-D models, go to mcmaster.com.

Linear Ball Bearings

For shafts and shaft supports, see pages 1074-1086.

Pillow-Block Linear Ball Bearings

To save time and installation costs, these bearings come mounted in an aluminum pillow block. They have end seals to keep lubricants in and dirt out. Maximum temperature is 176° F. Bearings are replaceable.

For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50.

Closed Bearings— Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Inch bearings are self-aligning and handle up to 1° of shaft misalignment in any direction (unless noted). Shell is acetal; balls are steel. Height tolerance (G) is ±0.0012″, unless noted.

Metric bearings are fixed-alignment style and are for use where shaft misalignment is unlikely. Shell and balls are steel. Height tolerance (G) is ±0.02 mm.

● Handles up to 1/2° of shaft misalignment. ■ Height tolerance (G) is ±0.003″.

High-Capacity Pillow-Block Linear Ball Bearings

Closed Bearing

Open Bearing

Heavy loads demand high capacities, which is what these bearings provide. The bearings are smooth running, self-aligning, and handle up to ½° of shaft misalignment in any direction. They have end seals to keep lubricants in and dirt out. Pillow block is aluminum, shell is acetal, and balls are steel. Height tolerance (G) is ±0.003″. Maximum temperature is 185° F. Bearings are replaceable.

For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50.

Closed Bearings— Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Corrosion-Resistant Pillow-Block Linear Ball Bearings

Closed Bearing with Aluminum Pillow Block

Closed Bearing with Plastic Pillow Block

Open Bearing with Aluminum Pillow Block

Outdoor as well as mild chemical environments are no problem for these bearings. All have Type 440C stainless steel balls for corrosion resistance. End seals keep lubricants in and dirt out. Maximum temperature is 176° F.

Closed Bearings— Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Bearings with aluminum pillow block take on heavier loads than bearings with a plastic pillow block. They have smooth-running, self-aligning bearings that handle up to 1° of shaft misalignment in any direction. The shell is acetal. Height tolerance (G) is ±0.0012″. For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C60. Bearings are replaceable.

Bearings with plastic pillow block are more corrosion resistant and are lighter in weight than bearings with an aluminum pillow block. They have fixed-alignment bearings and are for applications where shaft misalignment is unlikely. The shell is nickel-plated steel. Height tolerance (G) is ±0.004″. For use with hardened shafts made of steel with a hardness of at least Rockwell C60 or made of stainless steel with a hardness of at least Rockwell C56. Bearings are not replaceable.

For information about linear bearings, see page 1087. For shafts and shaft supports, see pages 1074-1086.

Adjustable Pillow-Block Linear Ball Bearings

Use the adjustment screw in the pillow block to tighten or loosen the snugness (also known as preload) of the bearing to your shaft. All of these bearings are closed bearings and can be mounted in any position without affecting load capacity. They are self-aligning and handle up to 3° of shaft misalignment in any direction. End seals keep lubricants in and dirt out. Pillow block is cast iron. Shell and balls are steel. Height tolerance (G) is ±0.005″. Maximum temperature is 180° F.

For use with end-supported, hardened shafts made of steel with a hardness of at least Rockwell C60 or made of stainless steel with a hardness of at least Rockwell C53.

Flange-Mount Linear Ball Bearings

The flange-mount design makes these closed bearings a good solution for vertical linear motion applications. All can be mounted in any position without affecting load capacity. They have fixed-alignment bearings and are for use where shaft misalignment is unlikely. End seals keep lubricants in and dirt out. Use with end-supported, hardened steel or stainless steel shafts with a hardness of at least Rockwell C56.

***Steel Bearings*—**Flange, shell, and balls are steel. Maximum temperature is 176° F.

***Stainless Steel Bearings*—**Flange, shell, and balls are Type 440C stainless steel for corrosion resistance. Maximum temperature is 248° F.

Aluminum Housings for Linear Bearings

Need to position your linear bearing or mount it to a surface? Just slide your ball or sleeve bearing (not included) into one of these aluminum housings and secure it with the included internal retaining rings. For bearing OD is oversized by 0.0005″.

Self-Aligning Linear Ball Bearings

Closed Bearing

Open Bearing

Our basic self-aligning bearings are smooth running and handle up to ½° of shaft misalignment in any direction. Bearings have end seals (unless noted) to keep lubricants in and dirt out. Maximum temperature is 176° F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually), except 6489K71 does not accept retaining rings. For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C60 (except 6489K71, 6489K61, 6489K62, 6630K12, 6630K13, and 6630K49 must be at least Rockwell C50).

Closed Bearings—Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings—Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Standard bearings have an acetal shell and steel balls.
Corrosion-resistant bearings have an acetal shell and Type 440C stainless steel balls.

High-Capacity Self-Aligning Linear Ball Bearings

Closed Bearing

Open Bearing

Designed to take on your heavy loads, these self-aligning bearings are smooth running and handle up to ½° of shaft misalignment in any direction. Bearings have end seals (unless noted) to keep lubricants in and dirt out. Maximum temperature is 176° F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C50.

Closed Bearings—Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings—Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Inch and ***metric sizes*** have an acetal shell and steel balls.
Corrosion-resistant inch sizes have an acetal shell and Type 440C stainless steel balls.

For information about linear bearings, see page 1087. For shafts and shaft supports, see pages 1074-1086.

Fixed-Alignment Linear Ball Bearings

The popular choice for applications where shaft misalignment is unlikely.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with hardened shafts made of steel, chrome-plated steel, or stainless steel with a hardness of at least Rockwell C56 (unless otherwise indicated).

Closed Bearings— Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Steel bearings have a steel shell and balls. End seals keep lubricants in and dirt out. Maximum temperature is 176° F.

High-temperature steel bearings have a steel shell and balls. They do not have end seals. Maximum temperature is 500° F.

Stainless steel bearings have a Type 440C stainless steel shell and balls for corrosion resistance. End seals keep lubricants in and dirt out. Maximum temperature is 248° F.

High-temperature stainless steel bearings have a Type 440C stainless steel shell and balls for corrosion resistance. They do not have end seals. Maximum temperature is 600° F (load capacity is 60% at maximum temperature). For use with hardened shafts made of Type 440C stainless steel.

● Housing bore minimum is –0.001″; maximum is +0.003″.

Combination Linear/Rotary Ball Bearings

Innovatively engineered for simultaneous linear and rotary motion, these bearings allow rotary speeds up to 3,600 rpm. All are closed bearings and can be mounted in any position without affecting load capacity. They also have a fixed-alignment design and are for use where shaft misalignment is unlikely. End seals keep lubricants in and dirt out. Shell and balls are steel. Maximum temperature is 200° F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with end-supported, hardened shafts made of steel or chrome-plated steel with a hardness of at least Rockwell C58; stainless steel with a hardness of at least Rockwell C50.

Note: When used for combination linear/rotary motion, the load capacity must not exceed the dynamic load capacity for rotary motion listed.

Metric Fixed-Alignment Linear Ball Bearings

Closed Bearing

Open Bearing

The metric option for applications where shaft misalignment is unlikely. To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually) except for 61205K71, 61205K72, 63255K41, and 63255K42, which do not have retaining ring grooves.

For use with hardened shafts made of steel with a hardness of at least Rockwell C60 or made of stainless steel with a hardness of at least Rockwell C56.

Closed Bearings— Mount in any position without affecting load capacity. Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Steel bearings have a steel shell and balls. End seals keep lubricants in and dirt out (except for 61205K71 and K72, which do not have end seals). Maximum temperature is 176° F.

High-temperature steel bearings have a steel shell and balls. They do not have end seals. Maximum temperature is 230° F.

Stainless steel bearings have a Type 440C stainless steel shell and balls for corrosion resistance. End seals keep lubricants in and dirt out. Maximum temperature is 248° F.

Washdown Pillow-Block Linear Sleeve Bearings

1″ Overall Length

2″ Overall Length

Not many bearings can do the job in wet or washdown environments. These one-piece, closed-style bearings can, and without the need for lubrication since they're made entirely of inherently slippery, corrosion-resistant UHMW. All have a fixed alignment design and are for use in light duty applications where shaft misalignment is unlikely. Maximum PV is 2,000. Temperature range is –200° to +180° F.

For use with any end-supported, polished, hardened steel or stainless steel shafts. USDA and FDA compliant.

For information about linear bearings, see page 1087. For shafts and shaft supports, see pages 1074-1086.

Self-Lubricating Pillow-Block Linear Sleeve Bearings

Virtually maintenance free, these bearings have slippery liners that don't require added lubrication. They are designed to be dimensionally compatible drop-in replacements for pillow-block linear ball bearings. Maximum PV is 20,000.

Closed bearings are for use with end-supported shafts.

Open bearings are designed for applications requiring maximum rigidity. Use with shafts with support rail.

Closed Bearing

Open Bearing

Fixed Alignment

For use where shaft misalignment is unlikely. Liner is chemical-resistant PTFE with no abrasive fillers. Shell and pillow block are aluminum. Shaft clearance is 0.001″. Temp. range is –400° to +375° F.

For use with shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Self Aligning

Allow up to 1/2° of shaft misalignment in any direction. Liner is chemical-resistant Frelon (a PTFE-filled composite) for wear resistance and strength. Shell and pillow block are aluminum. Temperature range is –400° to +400° F.

For use with shafts that have a hardness of at least Rockwell C60 and an 8-16 rms micron finish. *Note:* Not for use with bare aluminum, chrome-plated steel, or 300 series stainless steel shafts.

To Order: Please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″).

High-Speed Pillow-Block Linear Sleeve Bearings

Closed Bearing

Open Bearing

A 0.002″ thick ceramic coating makes high speeds as well as rapid acceleration and deceleration possible. Bearings are self-aligning and handle up to 2° of shaft misalignment in any direction. All require a thin film of lubrication and are designed to be dimensionally compatible drop-in replacements for pillow-block linear ball bearings. A grease fitting allows easy lubrication. Seals keep contaminants out. Shell and pillow block are aluminum. Shaft clearance is 0.0005″ to 0.0006″. Maximum PV is 40,000. Height tolerance (G) is ±0.003″. Temperature range is –200° to +400° F.

For use with shafts that have a hardness of at least Rockwell C60 and an 8-16 rms micron finish. *Note:* Not for use with ceramic-coated aluminum or 300 series stainless steel shafts.

Closed Bearings— Use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

Flange-Mount Linear Sleeve Bearings

Frelon Lined

Ceramic Coated

The flange-mount design makes these closed-style, self-aligning bearings a good solution for vertical linear motion applications. Shell and flange are aluminum. For use with end-supported shafts that have a hardness of at least Rockwell C35 and an 8-12 rms micron finish. *Note:* Do not use Frelon-lined bearings with bare aluminum or chrome-plated steel shafts.

Frelon-Lined Bearings— These self-lubricating bearings allow up to 1/2° of shaft misalignment. Liner is chemical-resistant Frelon (a PTFE-filled composite) for wear resistance and strength. Maximum PV is 20,000. Temperature range is –400° to +400° F. **To Order:** Please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″).

Ceramic-Coated Bearings— Handle up to 2° of shaft misalignment. All have a 0.002″ thick ceramic coating that makes high speeds as well as rapid acceleration and deceleration possible. A grease fitting allows easy lubrication. Seals keep contaminants out. For optimum performance, these bearings require a thin film of lubrication. Shaft clearance is 0.0005″. Maximum PV is 40,000. Temperature range is –200° to +400° F.

Self-Aligning Linear Sleeve Bearings

Closed Bearing

Open Bearing

Our basic self-aligning bearings allow up to 2° of shaft misalignment in any direction. Virtually maintenance free, they have a nonabrasive, chemical-resistant PTFE liner that doesn't require added lubrication. All are designed to be dimensionally compatible drop-in replacements for linear ball bearings. Shell is aluminum with a 0.002″ thick ceramic coating for added corrosion resistance. Shaft clearance is 0.001″ for 1/4″ to 1 1/4″ dia.; 0.0015″ for 1 1/2″ and 2″ dia. Maximum PV is 30,000. Temperature range is –400° to +375° F.

To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually). For use with shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Closed Bearings— For use with end-supported shafts.

Open Bearings— Designed for applications requiring maximum rigidity. Use with shafts with support rail.

For information about linear bearings, see page 1087. For shafts and shaft supports, see pages 1074-1086.

Fixed-Alignment Linear Sleeve Bearings

Select these bearings for applications where shaft misalignment is unlikely. All are designed to be dimensionally compatible drop-in replacements for linear ball bearings. To install, slide bearings into a housing (not included) and secure with two external retaining rings (sold individually).

Closed Bearings— Use with end-supported shafts.
Open Bearings— For applications requiring maximum rigidity. Use with shafts with support rail.

Frelon-lined bearings have a chemical-resistant Frelon liner (a PTFE-filled composite) for wear resistance and strength. Temperature range is –400° to +400° F. For use with shafts that have a hardness of at least Rockwell C35 and an 8-12 rms micron finish. *Note:* Not for use with bare aluminum, chrome-plated steel, or 300 series stainless steel shafts.

Bearings with an aluminum shell have an aluminum shell for good corrosion resistance. Maximum PV is 20,000. Metric sizes have a shaft clearance of 0.0005″. **To Order:** For inch sizes, please specify tight shaft clearance (0.0005″) or extra shaft clearance (0.0015″).

Bearings with a stainless steel shell have a Type 316 stainless steel shell for excellent corrosion resistance. Shaft clearance is 0.0005″. Maximum PV is 10,000.

PTFE-lined bearings have a chemical-resistant PTFE liner with no abrasive fillers. Shell is lightweight, nonmagnetic, electrically insulating fiberglass. Shaft clearance is 0.001″. Maximum PV is 30,000. Temperature range is –400° to +375° F. For use with shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

Rulon-lined bearings have a Type 304 stainless steel shell and an FDA- and USDA-compliant Rulon-641 liner for excellent chemical and corrosion resistance. Shaft clearance is 0.001″. Maximum PV is 10,000. Temperature range is –400° to +375° F. For use with shafts that have a hardness of at least Rockwell B25 and an 8-16 rms micron finish.

PTFE composite bearings have internal ridges to move dirt out of the way as they travel on a shaft. They are made entirely of lightweight, corrosion- and chemical-resistant, PTFE composite. Shaft clearance is 0.0013″-0.0036″. Maximum PV is 9,700. Temperature range is –40° to +194° F. For use with shafts that have a hardness of at least Rockwell C50 and a 4-16 rms micron finish.

Ceramic-coated bearings have a 0.002″ thick ceramic coating for high speeds; rapid acceleration and deceleration. They require a thin film of lubrication. Shell is aluminum for good corrosion resistance. Maximum PV is 40,000. Shaft clearance is 0.0005″ for 1/4″ to 5/8″ dia.; 0.0008″ for 3/4″ and 1″ dia. Temperature range is –200° to +400° F. For use with shafts that have a hardness of at least Rockwell C60 and an 8-16 rms micron finish.

About Linear-Motion Carriages and Guide Rails

Carriage Mounting Options

We offer a variety of carriages and guide rails to meet your precision automation needs.

Ball-Bearing Carriages (pages 1096-1100)— Our most common carriages have ball bearings to smoothly move your loads at high speeds with low friction. Ball-bearing carriages are some of the highest capacity linear motion products we offer. They're often used in parallel rail configurations.

Sleeve-Bearing Carriages (pages 1100-1101)— An economical alternative to ball-bearing carriages, these products are great for harsh environments because they are less likely to be hindered by dirt and debris. They do, however, require greater force to move because they create more friction than ball-bearing carriages.

Carriage Mounting Options

Threaded-hole carriages allow mounting from the top of your load into the carriage. They generally have a smaller footprint than through-hole carriages. All mounting holes are threaded.

Through-hole carriages have a flanged design with unthreaded or threaded mounting holes through the flange. This design generally allows mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Carriages and guide rails generally provide greater precision and rigidity in a smaller footprint than shafts and pillow-block linear ball bearings starting on page 1087. For lighter loads or less-precise applications, you may wish to consider low-friction slides or track rollers starting on page 1102.

Ball-Bearing Carriages and Guide Rails

Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage

Standard Guide Rail

High-Load Guide Rail

Our most popular carriages and guide rails provide precise, rigid linear motion. Install them in any position without affecting load capacity. Maximum temperature is 176°F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load (unless noted).

Standard Carriages— Made of steel with rubber end seals to keep lubricants in and dirt out. All have steel ball bearings and four mounting holes.

High-Load Carriages— Steel cylindrical roller bearings allow high load capacities. An internal retainer separates the roller bearings and keeps them moving uniformly, providing smoother, quieter operation. Carriages are made of steel with an internal tube that delivers oil to the roller bearings. All have six mounting holes.

Guide Rails— Made of hardened and ground steel. **To Order:** For rails, please specify length from the choices listed below, or go to www.mcmaster.com and specify the part number listed to see other available lengths. **Also Available:** Mounting hole plugs for *standard guide rails*. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Replacement Carriages and Guide Rails

Looking to replace an existing carriage or guide rail from THK, Bosch, NSK, or IKO? Just tell us what you need and we'll get it for you.

To Order: Please specify the following: (1) Our part number for the manufacturer listed below; (2) the manufacturer's model number for the carriage or guide rail; and (3) if you are ordering a guide rail, the length of the rail you need.

Manufacturer	
THK	2590T4
Bosch	2687T3
NSK	2690T2
IKO	2692T1

Extended-Life Ball-Bearing Carriages and Guide Rails

Compared to conventional carriages, these will last longer. Carriages are made of steel with rubber end seals to keep lubricants in and dirt out. All have steel ball bearings and four mounting holes. Maximum temperature is 176° F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Versa-Mount Carriages— An internal resin cage separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings. Versa mount means you can install these carriages in any position without affecting load capacity.

Horizontal-Mount Carriages— A compact design gives these carriages high rigidity and stability, which makes them the choice for horizontal mounting. The orientation of the ball bearings on the guide rails extends the life of the bearings. In addition to rubber end seals, these carriages also have rubber side seals for added protection from contaminants.

Quiet-Ride Horizontal-Mount Carriages— Just like the *Horizontal-Mount Carriages*, but with an internal plastic cage that separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings.

Guide Rails— Made of hardened and ground steel. **To Order:** For rails, please specify length from the choices listed below. **Also Available:** Mounting hole plugs. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Guide Rail Covers

Also known as linear way covers, these easy-to-install covers protect your carriages and guide rails from dirt, dust, chips, and other contaminants. Highly resistant to coolants and oils, they're made of 0.01″ thick PVC-coated seamless polyester fabric, bonded to PVC stiffeners. Maximum temperature is 170° F.

To Order: Please specify expanded length in feet (compressed length is 1/13 the expanded length).

Mounting kits include everything you need to mount the cover on both ends of your guide rail via clip-on, compression, hook-and-loop, flange mounting, or double-sided tape.

For information about carriages and guide rails, see page 1096.

Maintenance-Free Ball Bearing Carriages and Guide Rails

Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rail with Carriage

An internal reservoir continuously supplies built-in oil for maintenance-free operation, making these carriages and guide rails great for hard-to-reach places where maintenance would be difficult to perform. They can be mounted in any position.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Maintenance-Free Carriages and Guide Rails— The carriages and ball bearings are steel; guide rails are hardened and ground steel.

Corrosion-Resistant Maintenance-Free Carriages and Guide Rails— The carriages, ball bearings, and guide rails are 400 series stainless steel.

To Order: For all guide rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Corrosion-Resistant Ball Bearing Carriages and Guide Rails

Threaded-Hole Carriage and Guide Rail (Sold Separately)

Through-Hole Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage

Corrosion-Resistant Guide Rail, 5708K

Corrosion-Resistant Guide Rail, 9070T

Clean-Room Corrosion-Resistant Guide Rail

The stainless steel used to make these carriages and guide rails gives you excellent corrosion resistance. All carriages and guide rails can be mounted in any position. When wall mounted, however, corrosion-resistant threaded-hole carriages provide 84% of the dynamic load capacity listed below. All carriages have four mounting holes.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Corrosion-Resistant Threaded-Hole Carriages— Made of Type 440C stainless steel and acetal, these carriages have lubricating end seals that are made of oil-impregnated poly-olefin. All have Type 440C stainless steel ball bearings. Maximum temperature is 122° F.

Corrosion-Resistant Unthreaded Through-Hole Carriages— Made of 400 series stainless steel and resin with rubber end seals to keep lubricants in and dirt out. Ball bearings are 400 series stainless steel. Maximum temperature is 176° F.

Clean-Room Corrosion-Resistant Carriages— Suitable for clean room use, these carriages are made entirely of Type 440C and Type 304 stainless steel. End seals and end plates keep lubricants in and dirt out. Maximum temperature is 266° F.

Guide Rails— Made of hardened and ground 400 series stainless steel. **To Order:** For all rails, please specify length from the choices listed below. **Also Available:** Mounting hole plugs. For 5708K rails, please ask for 5708K1 and specify your rail's socket head cap screw size. For 9070T rails, please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

For information about carriages and guide rails, see page 1096.

Extra-Wide Ball Bearing Carriages and Guide Rails

With their added width and low-profile design, these carriages and guide rails have more stability to handle your off-center loads. Install them in any position without affecting load capacity. All of the carriages are made of steel with rubber end seals to keep lubricants in and dirt out. The ball bearings are steel. Maximum temperature is 176° F.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Standard Carriages— Have six mounting holes, except 6382K21 and 6382K31 have four.

Extended-Life Carriages— Able to last twice as long as conventional carriages, these have an internal resin cage that separates the ball bearings to minimize noise, reduce heat buildup, and eliminate ball collisions to extend the life of the bearings. They have six mounting holes, except 8375K11 has four.

Guide Rails— Made of hardened and ground steel. **To Order:** For all rails, please specify length from the choices listed below. For *standard rails*, you can also go to www.mcmaster.com and specify the part number listed below to see other available lengths. **Also Available:** Mounting hole plugs for all rails. Please ask for 6709K9 and specify your rail's socket head cap screw size.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Miniature Ball Bearing Carriages and Guide Rails

When space is at a premium, these are the carriages and guide rails to choose. Install them in any position without affecting load capacity. All are made of corrosion-resistant stainless steel. The carriages are threaded-hole carriages, which allow mounting from the top of your load into the carriage.

Standard Carriages— Made of Type 440C stainless steel. Rubber end seals and resin plates keep lubricants in and dirt out. All have stainless steel ball bearings. They also have four mounting holes, except 8438K1 and 9706K1 have two. Maximum temperature is 212° F, except 8438K1 is 176° F.

Clean Room Carriages— Suitable for clean room use, these carriages are made entirely of Types 440C and 304 stainless steel. End seals and plates keep lubricants in and dirt out. Carriages have four mounting holes, except 6725K1 has two. Maximum temperature is 266° F.

Guide Rails— Made of hardened and ground Type 440C stainless steel. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

For information about carriages and guide rails, see page 1096.

Ultra-Miniature Ball Bearing Carriages with Guide Rails

Small enough to fit on the tip of your finger, these tiny carriages and guide rails are sized for electronic, medical, and other precision applications. They come furnished as a complete unit (a carriage on a guide rail) and can be installed in any position without affecting load capacity. Maximum temperature is 212° F.

All carriages and guide rails are made of Type 440C stainless steel. The ball bearings are Type 440C stainless steel and are not retained, so they will fall out if the carriage is removed from the guide rail. The carriages have two threaded through-holes for mounting.

Mounting Bracket— For use with 8381K27 and 8381K28, which do not have mounting holes on their guide rails. Order a mounting bracket for each end of the rail.

Sleeve-Bearing Carriages and Guide Rails

Rulon-Lined Carriage and Guide Rail (Sold Separately)

Nylon-Lined Carriage and Guide Rail (Sold Separately)

Frelon-Lined Carriage and Guide Rail (Sold Separately)

PTFE-Lined Carriage and Guide Rail (Sold Separately)

Profile of Guide Rails with Carriage

Rulon-Lined Guide Rail

Nylon-Lined Guide Rail

Frelon-Lined Guide Rail

PTFE-Lined Guide Rail

The sleeve bearings in these carriages handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All of the carriages and guide rails are made of corrosion-resistant materials. They do not require lubrication. Load capacity is diminished when blocks are mounted upside down, vertically, or on their side.

Threaded-hole carriages allow mounting from the top of your load into the carriage. ***Through-hole carriages*** allow mounting from the top of your load into the carriage as well as from the bottom of the carriage into your load.

Rulon-Lined Carriages and Guide Rails— Carriages are ceramic-coated aluminum with an FDA- and USDA-compliant Rulon 641 liner for excellent chemical resistance. They have four threaded through-holes for mounting. Guide rails are ceramic-coated aluminum. Maximum temperature is 375° F.

Nylon-Lined Carriages and Guide Rails— Carriages are anodized aluminum and lined with bronze- and PTFE-impregnated nylon. They have four threaded holes for mounting. Guide rails are anodized aluminum. Maximum temperature is 175° F.

Frelon-Lined Carriages and Guide Rails— Carriages are anodized aluminum with a chemical-resistant Frelon liner (a PTFE-filled composite) for wear resistance and strength. They have four threaded through-holes for mounting. Guide rails are ceramic-coated anodized aluminum. Load capacity is for horizontal mounting only. Maximum temperature is 300° F.

PTFE-Lined Carriages and Guide Rails— Carriages are PTFE-lined anodized aluminum (except for 9867K1, which is die cast zinc) for good abrasion resistance. All have four threaded through-holes for mounting. *Lockable carriages* also have a plastic knob on the side to lock them in place along the rail. Guide rails are anodized aluminum. Maximum temperature is 194° F.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

For information about carriages and guide rails, see page 1096.

Low-Profile Sleeve-Bearing Carriages and Guide Rails

Snug mounting heights are no problem for these low-profile, low-maintenance carriages and guide rails. Use them for light to moderate loads, and frequent starting and stopping applications where tight tolerances are not required. Maximum temperature is 194° F.

Carriages— Made of chromated zinc (unless noted) with a PTFE liner for smooth, quiet operation. Their sleeve bearings handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All are self-lubricating. 6723K9 and 6723K12 have two threaded holes, 6723K11 has two unthreaded through-holes, and 6723K13 has four threaded holes for mounting.

Guide Rails— Made of anodized aluminum. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Square Sleeve-Bearing Carriages and Guide Rails

No need for parallel shafts—the square design of these carriages and guide rails prevents unwanted rotation of loads. Install them in any position, but keep in mind the capacity listed is for loads directly centered on a carriage on any one of its sides. Maximum temperature is 400° F.

Carriages— Made of anodized aluminum alloy with self-lubricating Frelon-lined bearing plugs on all four sides, which you can adjust to maintain precise alignment. Frelon (a PTFE-filled composite) is chemical resistant and provides wear resistance and strength. The sleeve bearings in these carriages handle harsh conditions that ball bearings can't, such as dirt, water, impact, and vibration. All have threaded through-holes for mounting.

Guide Rails— Made of hollow Type 304 stainless steel with a 0.12″ wall thickness. **To Order:** For rails, please specify length: 2, 3, 4, or 6 ft.

Rail Supports— Made of cast aluminum. *End rail supports* have four 0.25″ dia. through-holes for mounting. *Mid rail supports* also have four through-holes for mounting (0.20″ dia. for 60255K34; 0.25″ dia. for 60255K35).

NEMA Motor-Mount Slides

Add your NEMA 17 or 23 motor and you're ready for precise linear motion. These highly rigid slides have a precision lead screw, ball bearing carriage, and shaft coupling already installed. Mount them horizontally and vertically.

Frame and carriage are aluminum. Lead screw is Type 303 stainless steel. Guide rails are hardened steel. Base has M5 Dia. × 5.5 mm Dp. through-holes with a 9 mm Dia. × 5.5 mm Dp. counterbore for mounting. Straightness accuracy is 0.0002″ per inch of travel. Maximum motor input is 2,000 rpm. Maximum temperature is 180° F. **To Order:** Please specify screw lead (the distance a load moves with one revolution of the lead screw): 0.125″, 0.25″, 0.5″, or 1″.

Low-Friction Slides

Low Profile

End View

Side View

Standard Height

Excellent for short-travel, high-speed applications where low-friction performance is a must. Slides have a lightweight, corrosion-resistant aluminum carriage with threaded holes and a base with counterbored holes for socket head cap screws (unless noted). Carriage and base are the same length; to achieve travel, carriage must move beyond the base. Capacities listed are for horizontal mounting. If side mounted, load capacity is cut in half.

Ball Bearing Style Slides— A row of ball bearings on each side of the base provides high-precision linear motion. Bearings are caged in a retainer, which eliminates ball collisions to extend service life.

Choose *low-profile slides* for limited-space applications. Raceway rods and balls are steel. Straightness accuracy is 0.0005″ per inch of travel. Maximum temperature is 180° F.

Standard-height slides have raceway rods and balls that are made of Type 440C stainless steel. Straightness accuracy is 0.00008″ per inch of travel. Maximum temperature is 150° F.

High-Load Cylindrical-Roller Bearing Style Slides— Compared with similar-sized ball bearing slides, these offer higher load capacities. The cylindrical roller design lets the slides handle forces in any direction, so they're good for sudden loads and overhanging loads. Rollers ride on a pair of rails on each side of the base. Rollers and rails are hardened steel with stainless steel end caps. Straightness accuracy is 0.0001″ per inch of travel. Maximum temperature is 220° F.

High-Capacity Manual-Position Slides

Top View

Side View

To handle high loads, these slides have an aluminum carriage lined with Frelon (a PTFE-filled composite). They also have a Type 303 stainless steel precision lead screw, which makes them good for manual-positioning applications. Lead screws are accurate to 0.0006″ per inch of travel. Screw lead (the distance a load moves with one revolution of the screw) is 0.19″. Maximum temperature is 300° F.

All of these slides have self-lubricated sleeve bearings to move smoothly, even in dirty environments. End blocks are aluminum. Carriages have four threaded holes. Depending on length, rails for 499-lb. capacity slides have 4, 8, or 12 counterbored unthreaded holes centered on the rail with an M3 cap screw size. Rails for 800-lb. capacity slides have 3, 5, or 8 counterbored unthreaded holes centered on the rail with an M5 cap screw size. For horizontal mounting.

X-Y plates let you mount a second slide for motion in two directions. They have four counterbored through holes (cap screw size is M3 for 9222T41; M4 for 9222T42).

Manual-Position Slides

A precision lead screw allows you to use these slides in a variety of manual-positioning applications for laboratory and production equipment as well as for positioning parts in drilling, fastening, assembly, and gauging jobs. The lead screw is Type 303 stainless steel for 15- and 30-lb. capacity models; nickel-plated steel for 100-lb. capacity models. Screw lead (the distance a load moves with one revolution of the screw) is listed in the table.

All of these slides have Rulon-lined sleeve bearings to move smoothly, even in dirty environments. The carriages and bases are made of aluminum. Carriages have four threaded mounting holes. Bases have two or more countersunk mounting holes for flat head screws. Capacities listed are for horizontal mounting. When mounted vertically, the load capacity is cut in half. Maximum temperature is 180° F.

Precision Slides— Lead screws are accurate to 0.007″ per 10 inches of travel.

Ultra-Precision Slides— Have a micrometer-like position readout (to 0.001″) for measuring travel distance. They also have linear scales with 0.025″ divisions and index pointers. Lead screws are accurate to 0.0015″ per 10 inches of travel.

High-Speed Needle-Roller Bearing Carriages and Guide Rails

The needle-roller bearings inside these carriages give you smooth operation at faster speeds than ball bearing and track roller carriages. Rollers are made of steel and are permanently lubricated, saving maintenance time and effort. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 176° F.

Carriages— Made of aluminum with nylon end caps. All have four threaded through-holes for mounting.

Lockable carriages also have a side handle to lock them in place along the rail. Clamping force is 44 lbs. for 9881K22, 56 lbs. for 9881K33, and 78 lbs. for 9881K44.

Guide Rails— Made of anodized aluminum with hardened and ground steel inserts. The rollers ride on the inserts. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Track Roller Carriages and Guide Rails

Suitable for dirty environments, these lightweight, easy-to-install carriages have four external V-groove track rollers that are lubricated and sealed for life. They are also extra wide for greater rigidity and load capacity. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 158° F.

Carriages— Made of aluminum with steel rollers. All have six threaded through-holes for mounting.

Guide Rails— Made of hardened steel. **To Order:** For rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Miniature Track Roller Carriages and Guide Rails

Steel-Wheel Carriage and Guide Rail (Sold Separately)

Sized just right for electronic, medical, and packaging applications, these compact carriages and guide rails have V-groove wheels and a double-edged track for smooth, precise movement. Install these carriages and guide rails in any position without affecting load capacity. Maximum temperature is 248° F.

Carriages— Made of anodized aluminum, these carriages come lubricated and have two adjustment screws that allow you to tighten or loosen snugness on the rail. All have four threaded mounting holes. *Steel wheels* allow for a higher load capacity. *Polymer wheels* are lightweight and suitable for corrosive environments.

Guide Rails— Made of carbon steel. ***Rail support spacers*** (sold separately) are required for carriage clearance. **To Order:** For rails, please specify length from the choices listed below.

Side-Mount Track Roller Carriages and Guide Rails

Track Roller Carriage and Guide Rail (Sold Separately)

V-Groove Track Roller Carriage and Guide Rail (Sold Separately)

Lightweight and easy-to-install for applications that require side mounting.

Carriages with Steel Track Rollers— These carriages and guide rails have three internal track rollers for fast speeds and quiet operation. Their enclosed track design keeps out large debris, plus they can generally sustain greater loads than standard track-roller systems. Maximum temperature is 180° F.

All of the carriages are aluminum and allow you to adjust how snug the roller fits to the rail. They have two threaded through-holes for mounting. *Metric carriages* also have end caps with oil-impregnated plastic wipes that slide along the rail to sweep away contaminants. All rails are aluminum with hardened and ground steel raceways.

Carriages with Steel V-Groove Track Rollers— These carriages and guide rails have four external V-groove track rollers that create less friction than linear ball bearings. The rollers are lubricated and sealed for life, so they are suitable for dirty environments. Maximum temperature is 176° F.

All carriages are anodized aluminum and have six threaded holes for mounting. The rails are anodized aluminum with hardened steel raceways.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Light Duty Side-Mount Carriages and Guide Rails

Plastic Roller Carriage and Guide Rail (Sold Separately)

Stainless Steel Ball Bearing Carriage and Guide Rail (Sold Separately)

Use these carriages and guide rails for light-load linear motion where tight tolerances aren't required. All are designed for side mounting. Maximum temperature is 176° F.

Carriage with Plastic Rollers— Made of steel with plastic rollers, this carriage offers a low-cost alternative to ball bearing carriages for light duty applications. It has four unthreaded through-holes for mounting. Rails are aluminum.

Carriages with Stainless Steel Ball Bearings— Carriages have two rows of recirculating, Type 440C stainless steel ball bearings. Steel retainers keep balls in when carriages are removed from the rails. Synthetic rubber end seals keep lubricants in and dirt out. All carriages have four threaded through-holes for mounting. Rails are Type 304 stainless steel. Use the optional *connector plates* to mount rails end to end for greater travel.

To Order: For all rails, please specify length from the choices listed below.

Note: Carriages can only be used with guide rails listed on the same line in the table.

Side-Mount Track Rollers and Guide Rails

Polymer Roller and Aluminum Rail (Sold Separately)

Stainless Steel Roller and Rail (Sold Separately)

Steel Roller and Rail (Sold Separately)

Just like on your garage door, these stud-mount rollers ride on a rail. They can be loaded for a snug or loose fit in the rail.

Polymer Rollers and Aluminum Rail— These economical rollers are polymer with Type 440C stainless steel shielded ball bearings. Rails are anodized aluminum. Maximum temperature is 158° F. The *6-lb. capacity rollers* have an M6 threaded stud; *12-lb. capacity rollers* have an M8 threaded stud.

Stainless Steel Roller and Rail— Offering excellent corrosion resistance, the roller is Type 440 stainless steel with double-sealed Type 440 stainless steel ball bearings. Roller has an M5 threaded stud. The rail is Type 316 stainless steel and can be cut to size. Maximum temperature is 212° F.

Steel Roller and Rail— This high-capacity roller is steel with double-sealed steel ball bearings. It has a 5/16″-18 threaded stud. The rail is powder-coated steel and can be cut to size. Maximum temperature is 176° F. Mount rail by drilling holes or use the *optional L-angle mounting bracket*, which is 1 9/32″ Lg. × 1 1/2″ Wd. × 0.120″ Thick. To install, weld bracket to back of rail. *Optional end stop* prevents overtravel of rollers but is not designed to support loads.

To Order: For all rails, please specify length from 1 to 8 ft. in 1-ft. increments.

Note: Track rollers can only be used with guide rails listed on the same line in the table.

Telescopic Slides

Allowing motion beyond your mounting surface, these slides are great for pick-and-place automated applications, machine tool doors, and telescopic industrial press arms. They function similarly to drawer slides, but they're more rugged and support heavier loads. Use them where tight tolerances are not required.

Slides are hardened zinc-plated steel with threaded through-holes. Ball bearings and rails are hardened steel. The rails accept flat head screws. Load capacities listed are for side mounting. If mounted horizontally or upside down, load capacity is 70% of the capacity listed. Not recommended for vertical mounting. Maximum temperature is 338° F.

Roller Bearing Slide Sets

Get low-profile, space-saving linear motion with these slide sets. A set includes four rails, two roller bearing cage slides, and eight end stops. Maximum temperature is 176° F.

Rollers are made of steel and are retained in a plastic cage. Rails are made of precision ground and hardened steel and have threaded and counterbored holes for easy mounting with socket head cap screws. Mount in any position without affecting load capacity.

Linear Bearings for T-Slotted Framing

Here's a versatile solution to guided linear motion applications that don't require high precision. *Note:* For structural hardware and accessories, see pages 1922-1925.

Sleeve-Bearing Carriages— Suitable for washdown applications, these carriages have an anodized aluminum shell that's lined with an extra-tough UHMW (ultra-high molecular weight) polyethylene bearing pad. The pads are self-lubricating and USDA approved. All of these carriages are designed for horizontal mounting. Maximum temperature is 180° F.

High-strength sleeve-bearing carriages have threaded inserts that secure the bearing pad lining to the outer shell. They're the choice for jobs with frequent starting and stopping. They're also good for pick and place, parts transfer, and other high-speed applications.

Track Roller Carriages— Made of aluminum with nylon rollers and permanently lubricated plain bronze bearings. You can use several of these carriages on a rail at once. Mount so wheels are positioned vertically. Two T-nut fasteners and two socket head cap screws are included. Maximum temperature is 150° F.

T-Slotted Guide Rails— Made of anodized aluminum, rails can be easily cut to length and drilled for mounting.

Optional hand brakes mount on the carriages to hold them in place on the rail. *Standard sleeve-bearing carriages* have a mounting hole for the brakes. *High-strength sleeve-bearing carriages* require you to drill a mounting hole for the brake.

Optional end caps mount on the rails to prevent overtravel.

T-nut fasteners (sold separately) let you mount components to the carriages.

About Precision Acme Threaded Rods

Count on precision Acme threaded rods to simply and effectively convert rotary motion into smooth, precise linear motion. Although not as efficient as ball screws, they're more economical and are great for handling jobs with lower speeds and fewer cycles.

Precision Acme threads are broader, stronger, and more square than standard V-shaped threads, which means they're better suited for carrying loads. They have a 2C (self-centering; tight and precise) thread fit and a smooth finish that increases rod life by reducing friction. Lower-precision general purpose Acme threaded rods have a 2G (general) thread fit. The 2C and 2G thread fits are compatible, but when used together you will lose the precision of the 2C thread fit.

Acme Size— Indicates the diameter of the rod and the number of threads per inch. For example, a rod with an Acme size of ½″-8 has a diameter of ½″ with 8 threads per inch.

Travel Distance per Turn— The distance a nut will travel with one revolution of the threaded rod. Accuracy for travel distance per turn is 0.009″ or better per foot.

Standard- and ***Fast-Travel Rods—*** The number of individual threads on a rod determines how fast a nut will travel on the rod. Our ***standard-travel rods*** (also known as single-start rods) are the most common rods and have a single thread that runs the length of the rod. Our ***fast-travel rods*** (also known as multiple-start rods) have multiple threads that run the length of the rod. Standard-travel rods must be used with standard-travel nuts and fast-travel rods must be used with fast-travel nuts.

Speed Ratio— Indicates how fast a nut will travel on the threaded rod. The first number in the speed ratio corresponds to the number of starts for that rod or nut. Compared to standard-travel rods, fast-travel rods provide more travel (speed) for each turn of the rod. For example:

Acme Size and Style of Rod	Speed Ratio	Travel Distance per Turn	Travel Distance per 100 Turns
¾″-8 Standard Travel	1:1	⅛″	12½″
¾″-8 Fast Travel	2:1	¼″	25″
¾″-8 Fast Travel	4:1	½″	50″

Right-Hand and Left-Hand Threads

Turn the threaded rods clockwise and your nuts will travel in the direction shown. *Note:* Right-hand threads are the most common threads.

Standard-Travel Precision Acme Threaded Rods

The workhorse of precision Acme threaded rod, these standard-travel (single-start) rods have a 1:1 speed ratio. Accuracy for travel distance per turn is 0.009″ or better per foot. Use with standard-travel nuts that have the same Acme size. For nuts, see the following page.

1018 Carbon Steel— Minimum tensile strength is 64,000 psi. Hardness is 126-180 Brinell. ***Heat-Treated 4140 Alloy Steel—*** Harder than 1018 carbon steel, these rods ensure greater strength and durability. Minimum tensile strength is 125,000 psi. Hardness is 271 Brinell. All have a black-oxide finish. ***Type 304 Stainless Steel—*** The choice for corrosion resistance. Minimum tensile strength is 72,000 psi. Hardness is 150-220 Brinell.

Precision Acme Threaded Rods

To Order: Please specify 3-ft. or 6-ft. lengths (except for Acme size ¼″-16 and ¼″-20 Type 304 Stainless Steel rods, which are only available in 6-ft. lengths).

Acme Size	Travel Dist. per Turn	Right-Hand Threads	Per Ft.	Left-Hand Threads	Per Ft.

For information about precision Acme threaded rods, see page 1107.

Standard-Travel Precision Acme Round Nuts and Mounting Flanges

Nut

Mounting Flange

Assembled Nut and Mounting Flange

Use these standard-travel (single-start) nuts and mounting flanges with the Standard-Travel Precision Acme Threaded Rods on the previous page. Use rods that have the same Acme size. Speed ratio is 1:1.

Bronze nuts and ***steel mounting flanges*** are good for most applications. ***Plastic nuts*** and ***Type 303 stainless steel mounting flanges*** offer corrosion resistance.

Bronze Nuts—Hardness is 70-126 Brinell. ***Plastic Nuts***—Made of FDA-compliant polyethylene terephthalate (PET).

Standard-Travel Machinable Precision Acme Nuts

Round Nut

Platform Nut

Use these standard-travel (single-start) machinable nuts with the Standard-Travel Precision Acme Threaded Rods on the previous page. Use rods that have the same Acme size. Speed ratio is 1:1. **To Order:** Please specify right- or left-hand threads (except for 1343K39, 1343K23, 1349K39, and 1349K23 which are right-hand thread only).

Round nuts have a large OD so you can machine them to your own specifications. ***Platform nuts*** have a platform that allows you to drill your own mounting holes for mounting flexibility.

Cast Iron—Hardness is 217-269 Brinell. ***660 and 932 Bronze***—Hardness is 65 Brinell. ***Plastic***—Corrosion resistant. Made of FDA-compliant polyethylene terephthalate (PET).

For information about precision Acme threaded rods, see page 1107.

Fast-Travel Precision Acme Threaded Rods

Multiple threads run the length of these fast-travel (multiple-start) rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods. Accuracy for travel distance per turn is 0.009″ or better per foot. Use with fast-travel nuts that have the same Acme size and speed ratio. **To Order:** Please specify 3-ft. or 6-ft. lengths (except for Type 304 stainless steel, which are only available in 6-ft. lengths).

1018 Carbon Steel— Minimum tensile strength is 64,000 psi. Hardness is 126-150 Brinell. ***Heat-Treated 4140 Alloy Steel—*** Harder than 1018 carbon steel, these rods ensure greater strength and durability. Minimum tensile strength is 125,000 psi. Hardness is 271 Brinell. All have a black-oxide finish. ***Type 304 Stainless Steel—*** The choice for corrosion resistance. Minimum tensile strength is 72,000 psi. Hardness is 150-220 Brinell.

Fast-Travel Precision Acme Round Nuts

Use these fast-travel (multiple-start) nuts with the Fast-Travel Precision Acme Threaded Rods on this page and the mounting flanges (see 95082A and 1329K) on the previous page. Use rods that have the same Acme size and speed ratio.

Bronze Nuts— Good for most applications. Hardness is 70 to 126 Brinell. ***Plastic Nuts—*** Made of FDA-compliant polyethylene terephthalate (PET).

Fast-Travel Machinable Precision Acme Round Nuts

Use these fast-travel (multiple-start) machinable nuts with the Fast-Travel Precision Acme Threaded Rods on this page. All have a large OD so you can machine them to your own specifications. Use rods that have the same Acme size and speed ratio. **To Order:** Please specify right- or left-hand threads, unless noted.

Cast Iron— Hardness is 217 to 269 Brinell. ***660 Bronze—*** Hardness is 65 Brinell. ***Plastic—*** Corrosion resistant. Made of FDA-compliant polyethylene terephthalate (PET).

Acme Threaded Rod Lubricants

Maximize the life of your threaded rods with these synthetic, corrosion-resistant lubricants. Operating temperature range is –10° to +400°F.

11.25-oz. (net wt.) Aerosol	1353K2	Each	$20.14
14.1-oz. Can	1378K34	Each	$11.21

For information about precision Acme threaded rods, see page 1107.

Miniature Corrosion-Resistant Precision Threaded Rods and Nuts

Threaded Rod

Standard Nut

Perfect for moving small loads in confined spaces, these rods and nuts are corrosion resistant and have right-hand threads. They're similar to, but not compatible with, precision Acme threaded rods and nuts. ***Fast-travel (multiple-start) rods*** have multiple threads that run the length of the rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods.

Threaded Rods— Made of Type 303 stainless steel, all are 18″ long. Accuracy for travel distance per turn is 0.0006″ per inch. Minimum tensile strength is 90,000 psi. Hardness is 160 Brinell.

Nuts— All are made of polyacetal and are self-lubricating. *Wear-compensating nuts* have an internal O-ring that maintains a tight thread fit even when threads begin to wear.

Metric Standard-Travel Precision Threaded Rods and Nuts

Threaded Rod

Nut with Flange

Machinable Nut

Made to DIN 103 standards, these rods and nuts (also known as trapezoidal thread form) offer the advantages of precision Acme threaded rods and nuts but in metric sizes. All are standard travel (single start) and have right-hand threads. Speed ratio is 1:1.

Threaded Rods— Made of 1018 carbon steel, these rods are 1,750 mm long. Accuracy for travel distance per turn is ±0.15 mm per 300 mm. Minimum tensile strength is 70,000 psi. Hardness is 150-180 Brinell.

Nuts with Flange— Nuts are bronze; flanges are steel. Nut hardness is 126 Brinell; flange hardness is 150-180 Brinell. Flange mounting holes are 0.266″ dia., unless noted.

Machinable Nuts— Bronze with oversized OD for machining. Hardness is 70 Brinell.

Ultra-Smooth Corrosion-Resistant Threaded Rods and Nuts

Threaded Rod

Standard Nut

Wear-Compensating Nut

Similar to, but not compatible with, precision Acme threaded rods and nuts, these rods and nuts have smoother and rounder thread edges for increased nut life and ultra-smooth travel. All are corrosion resistant and have right-hand threads. ***Fast-travel (multiple-start) rods*** have multiple threads that run the length of the rods, which means your nut will travel faster with each turn than on standard-travel (single-start) rods.

Threaded Rods— Made of Type 303 stainless steel, these rods are 6 feet long. Accuracy for travel distance per turn is ±0.0006″ per inch. Minimum tensile strength is 90,000 psi. Hardness is 160 Brinell. ***Nuts—*** All are polyacetal and self-lubricating. They have a flange with 0.2″ dia. mounting holes, unless noted. Minimum tensile strength is 9,700 psi. *Wear-compensating nuts* have a spring that maintains a tight fit even when threads begin to wear.

About Ball Screws and Ball Nuts

A ball nut contains ball bearings that circulate in the groove of a ball screw to reduce friction between the nut and the screw. Together they provide smooth, precise positioning control over the full length of the ball screw. They also convert rotary motion to linear motion more efficiently than precision Acme threaded rods. *Note:* Ball nuts are furnished with a cardboard tube to keep ball bearings in place. Do not remove the tube until you are ready to install the nuts onto the screws.

Travel Distance per Turn— Also known as screw lead, travel distance per turn is the distance a ball nut moves with one revolution of the ball screw. For proper fit, choose ball nuts with the same diameter and travel distance per turn as the ball screw.

Interior View of a Ball Nut on a Ball Screw

Ball Screws, Ball Nuts, and End Mounting Blocks

Ball Screws and End Mounting Blocks

Ball Screws— All are made of hardened alloy steel. They have right-hand rolled threads. Accuracy for travel distance per turn is ±0.004″ per foot. Rockwell hardness is C56. Temperature range is –65° to +300° F with a high-temperature lubricant. For use with ball nuts that have the same screw diameter and travel distance per turn. **To Order:** Please specify screw length in whole feet up to the maximum length listed.

End Mounting Blocks— Support ball screws (sold separately) to help eliminate wobble. Made of steel, each includes bearings, replaceable seals, a locknut, and a washer. Use one end mounting block for a floating setup or two end mounting blocks for a rigid setup. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Screws with One Machined End and End Mounting Blocks

Ball Screws with One Machined End— Identical to the ball screws above, except these have one end that has already been machined for you. The machined end fits perfectly into an end mounting block (sold separately) and is ready to connect to your motor. It has a standard Type III journal with drive extension. To adjust the length, the non-machined end can be cut to size.

End Mounting Blocks— For information and illustration, see above.

Ball Nuts and Ball Nuts with Flange

All of these ball nuts are made of heat-treated alloy steel with a black-oxide finish. The maximum play between the screw and the nut is 0.015″. Rockwell hardness is C56. Temperature range is –65° to +300° F.

For use with ball screws that have the same screw diameter and travel distance per turn. Load capacities are based on using a ball screw and a ball nut together.

For information about ball screws and ball nuts, see page 1111.

Corrosion-Resistant Ball Screws and Ball Nuts

Ball Screw

Round Ball Nut

Square Ball Nut with Flange

Suitable for use in harsh environments, all of these ball screws and ball nuts are Type 17-4 PH stainless steel. Rockwell hardness is C38. Temperature range is –30° to +180° F. Use ball screws and ball nuts with the same screw diameter and travel distance per turn. Flange (where applicable) is 300 series stainless steel.

Ball Screws— Have right-hand rolled threads. Accuracy for travel distance per turn is ±0.004″ per foot. They can be used with the steel end mounting blocks, which are sold on page 1111. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Nuts— The maximum play between the screw and the nut is 0.007″.

Metric Ball Screws, Ball Nuts, and End Mounting Blocks

Ball Screw

End Mounting Block

Ball Nut with Flange

Platform Ball Nut

Ball Screws— All are AISI 1055 alloy steel and have right-hand rolled threads. Accuracy for travel distance per turn is 0.210 mm per 300 mm. Rockwell hardness is C58-C64. Temp. range is 5° to 176° F. For use with ball nuts that have the same screw diameter and travel distance per turn.

End Mounting Blocks— Support ball screws (sold separately) to help eliminate wobble. Made of steel, each includes bearings, seals, and a locknut. Use one end mounting block for a floating setup or two end mounting blocks for a rigid setup. *Note:* The end of your ball screw must be machined before installing it into an end mounting block.

Ball Nuts— All are steel. Maximum play between screw and nut is 0.1 mm. Rockwell hardness is C58-C64. Temp. range is 5° to 176° F. For use with ball screws that have the same screw diameter and travel distance per turn.

Miniature Metric Ball Screws with Ball Nut

Ball Screw w/Included Ball Nut

Ball Nut

We've paired a ball screw and a ball nut, which have a small overall size and tiny travel distance per turn to tackle your miniature applications. Accuracy for travel distance per turn is 0.210 mm per 300 mm. Rockwell hardness is C58-C64. Temperature range is 5° to 176° F.

The ball screw is AISI 1055 alloy steel and has right-hand rolled threads. The ball nut is JIS G 4052 steel and has a flange. The maximum play between the screw and the nut is 0.05 mm.

Screw Jacks

Designed to convert rotary motion into linear motion, screw jacks are excellent for lifting, holding, positioning, and leveling loads. They have a worm gear for precise movement. Furnished assembled and threaded, they are ready for installation and motor hookup. Simply attach your motor shaft to the screw jack shaft. The screw jack shaft has a keyway at both ends (for shaft diameter and keyway dimensions, see below).

Mount these jacks vertically or horizontally. ***Upright style*** and ***inverted style*** refer to the mounting flange location in relation to the lift screw.

Travel Distance per Turn— Also known as screw lead, travel distance per turn is the distance a load is moved with one revolution of the lift screw.

Optional Mounting Attachments— Thread directly onto the jacks.

Acme Screw Jacks

Top View, 1-Ton Jack

Top View, 2-Ton Jack

Top View, 5-Ton Jack

Upright Style

Inverted Style

All jacks have a cold-rolled alloy steel lift screw. Accuracy for travel distance per turn is 0.010″ per foot. Maximum temperature is 250°F.

The ***1-ton jacks*** have sealed ball bearings and an aluminum alloy housing. Gear ratio is 5:1. The ***2-*** and ***5-ton jacks*** have tapered roller bearings and a ductile iron housing. Gear ratio is 6:1.

To Order: Please specify travel length in whole inches up to the maximum length listed. To determine your price, multiply the travel length per inch price by the number of inches you need, then add that to the base price of the jack.

Compact Screw Jacks

The choice for tight spots. **To Order:** Please specify travel length from those available below.

Compact Acme Screw Jacks— Housing is aluminum. Lift screw is 11L17 steel for 250-lb. jacks; Type 304 stainless steel for 500- and 1,000-lb. jacks. Accuracy for travel distance per turn is 0.010″ per foot. Gear ratio is 5:1. Max. temp. is 250°F.

Jacks with mounting plate have a 2 1/4″ Dia.×5/16″ Thick. plate with four 9/32″ dia. mounting holes (1 1/2″ center-to-center).

Compact Ball Screw Jacks— You'll get higher efficiency, longer duty cycles, and faster lifting speeds with half the power needed for Acme screw jacks. Housing is ductile iron. Lift screw is heat-treated steel. Accuracy for travel distance per turn is 0.044″ per foot. Gear ratio is 6:1. Max. temp. is 120°F.

About Track Rollers

Also known as cam followers, track rollers have a thick outer roller that runs directly on a flat surface. A rotary and linear application are shown at left.

Flat Rollers—The choice for perfectly flat surfaces, these rollers offer the best surface-to-surface contact.

Crowned Rollers—Have a slight curve, which is invisible to the naked eye, to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Mounting

Stud-Mount Rollers—Have a built-in threaded stud that can be through-hole mounted or threaded directly into a component. There are two styles of heads: ***hex socket head***, which installs with a hex key and is great for installations requiring greater tightening torque, and ***screwdriver slotted head***, which installs with a flat-blade screwdriver.

Shaft-Mount Rollers—Also known as yoke-style cam followers, these rollers have a bore for mounting onto a shaft or clevis (yoke) end linkage.

Load Ratings

Radial load, also known as rotary load, refers to the force that is applied perpendicular to the roller's outer surface. ***Thrust load***, also known as axial or side load, refers to the force that is applied parallel to the end of the roller. ***Dynamic loads*** refer to loads in motion that may change in direction or degree. ***Static loads*** refer to constant loads that do not change in direction or degree.

Lubrication

Most ***stud-mount rollers*** have a lubrication hole in the (1) side of the stud (access can be difficult once rollers are installed). Others allow lubrication through the (2) end of the stud and (3) head of the roller. Lubrication holes in all three points allow maximum access.

Shaft-mount rollers usually have a lubrication hole or groove in the roller's inner ring.

Long-Life Stud-Mount Track Rollers

Made to tight tolerances, these precision rollers have heat-treated steel needle bearings and last over twice as long as ordinary stud-mount track rollers. All are steel with a black-oxide finish on the external surfaces. Maximum temperature is 250° F. Mounting nut not included.

Hex socket head rollers are great for blind-hole installations and those requiring greater tightening torque. Lubrication holes are in the end and the side of the stud, unless noted.

Screwdriver slotted head rollers install with a flat-blade screwdriver. Lubrication holes are in the head as well as the end and the side of the stud, unless noted.

Flat rollers are the choice for perfectly flat surfaces. ***Crowned rollers*** stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. ***Sealed rollers*** have end seals to block contaminants.

♣ No lubrication holes. ● Has one lubrication hole, which is in the head.

For information about track rollers, mounting, load ratings, and lubrication, see page 1114.

Long-Life Shaft-Mount Track Rollers

Also known as yoke-style cam followers, these rollers have a bore for mounting onto a shaft or clevis (yoke) end linkage. They have needle bearings and provide roughly twice the life of ordinary shaft-mount rollers. Lubricate rollers through a hole and groove in the inner ring.

All rollers are steel with a black-oxide finish on the external surfaces. Maximum temperature is 250° F.

Flat rollers are the choice for perfectly flat surfaces. ***Crowned rollers*** stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. ***Sealed rollers*** have end seals to block contaminants.

Long-Life Track Rollers with Oversized Stud

Hex Socket Head

Screwdriver Slotted Head

An oversized stud roughly doubles the static load capacity of these rollers. All have needle bearings and provide twice the life of ordinary stud-mount rollers. They also have at least one lubrication hole in the side of the stud, unless noted.

All rollers are steel with a black-oxide finish on the external surfaces. Maximum temperature is 250° F. Mounting nut not included.

Flat rollers are the choice for perfectly flat surfaces. ***Crowned rollers*** stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. ***Sealed rollers*** have end seals to block contaminants.

To Order: Please specify roller head style: hex socket head or screwdriver slotted head.

★ Hex socket head rollers do not have lubrication holes.

Ultra Corrosion-Resistant Long-Life Track Rollers

Stud Mount (Hex Socket Head)

Shaft Mount

Made of Type 440C stainless steel, these track rollers offer excellent corrosion resistance. All have needle bearings and provide roughly twice the life of ordinary track rollers. End seals block contaminants. Maximum temperature is 250° F.

Stud-Mount Rollers— All have a hex socket head. Lubrication holes are in the end and the side of the stud, unless noted. Mounting nut not included.

Shaft-Mount Rollers— Lubricate these rollers through a hole and groove in the inner ring.

♣ No lubrication holes.

For information about track rollers, mounting, load ratings, and lubrication, see page 1114.

Easy-Lube Stud-Mount Track Rollers

With Standard Stud

With Oversized Stud

A unique design lets you lubricate these track rollers through their hex socket head when access to the stud is limited. They also have lubrication holes in the side and end of the stud for maximum access.

All of these rollers have needle bearings as well as end seals to block contaminants. They're made of steel. Maximum temperature is 250° F. Mounting nut included.

Flat rollers are the choice for perfectly flat surfaces. ***Crowned rollers*** stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. ***Rollers with oversized stud*** provide added stud strength and higher static load capacities.

Adjustable-Height Easy-Lube Stud-Mount Track Rollers

Fine-tune the distance between these rollers and your track by rotating the stud; it moves the roller position up and down up to 0.03" (0.015" on 3/4" and 7/8" dia. rollers). Lubricate these rollers through their hex socket head for easy access. All have needle bearings as well as end seals to block contaminants. Made of steel. Maximum temperature is 250° F. Mounting nut included.

Flat rollers are the choice for perfectly flat surfaces. ***Crowned rollers*** stay centered on surfaces that are not perfectly aligned and/or not perfectly flat.

Metric Stud-Mount Track Rollers

These metric-sized rollers have needle bearings and a hex head. All have one lubrication hole in the head, unless noted. They're made of high-carbon chromium steel. Mounting nut included.

Sealed rollers have seals to block contaminants

♣ No lubrication holes. ▲ Max. temp. is 176° F. ■ Lubrication holes in head as well as the end and side of the stud.

Heavy Duty Shaft-Mount Track Rollers

The outer ring is built to handle higher speeds than standard shaft-mount track rollers. Also known as yoke-style cam followers, these rollers have a bore for mounting onto a shaft or clevis (yoke) end linkage. All have an exposed internal cage with a large grease reservoir for lubrication. They're made of steel. Maximum temperature is 250° F.

Sealed rollers have end seals to block contaminants.

For information about track rollers, mounting, load ratings, and lubrication, see page 1114.

High-Performance Perma-Lube Track Rollers

With a double row of cylindrical roller bearings, these track rollers provide the highest combination of speed and dynamic radial load ratings of any track rollers we offer. The double row of bearings also compensates for minor misalignment and side loading and extends the roller life. All of these rollers are lubed for life with seals that retain lubricant and block contaminants. They're made of alloy steel. Maximum temperature is 250° F.

Stud-Mount Rollers— All have a hex socket head. Mounting nut included.

Metric Perma-Lube Stud-Mount Track Rollers

Lubed for life, these metric rollers have needle bearings that are packed in a unique solid lubricant. Seals block contaminants. All rollers are made of steel, have a hex socket head, and are crowned to stay centered on surfaces that are not perfectly aligned and/or not perfectly flat. Maximum temperature is 176° F. Mounting nut included.

Thrust-Load-Rated Perma-Lube Track Rollers

In addition to being rated for radial load, these rollers are also rated for thrust load. All are lubed for life with seals that retain lubricant and block contaminants. Maximum temperature is 225° F, unless otherwise stated.

Stud-Mount Rollers— Have a hex socket in the stud end. All have ball bearings, unless noted. Mounting nut included.

Shaft-Mount Rollers— All are alloy steel and have tapered roller bearings.

Corrosion-Resistant Stud-Mount Track Rollers

Looking for good corrosion resistance without the expense of solid stainless steel? These rollers have Type 440C stainless steel needle bearings and chrome-plated steel exposed surfaces to meet your needs. All have a hex socket head. Lubrication holes are in the side and end of the stud, unless noted. End seals block contaminants. Maximum temperature is 250° F. Mounting nut not included.

Miniature Corrosion-Resistant Stud-Mount Track Rollers

Made of Type 303 stainless steel, these tiny rollers offer excellent corrosion resistance. They are also rated for thrust load. All rollers are lubed for life. They have ball bearings and a screwdriver slotted head. Maximum temperature is 248° F. Mounting nut included.

Quiet-Grip Stud-Mount Track Rollers

Coated with nylon or urethane (see below), these steel rollers operate quietly and provide an excellent grip. End seals block contaminants. Mounting nut not included.

Nylon-Coated Steel— These rollers have an electrically nonconductive roller surface and are more chemical resistant than the urethane-coated rollers. Lubed for life, these rollers have ball bearings and a hex socket in the stud end. Hardness is Rockwell C85. Maximum temperature is 210° F.

Urethane-Coated Steel— Provide better traction and strength than the nylon-coated rollers. They are not, however, rated for speed or load. All have needle bearings and a hex socket head. Lubrication holes are in the side and end of the stud, unless noted. Hardness is Shore 80A. Maximum temperature is 200° F.

♣ No lubrication holes.

Extreme-Temperature No-Lube Stud-Mount Track Rollers

Commonly used in ovens, furnace doors, and even radioactive environments, these rollers handle temperatures from –452° to +750° F—the widest temperature range of any track roller we offer. They're also maintenance free with no grease to leak and no internal bearings to seize (all have sleeve bearings). Great for low-speed, light radial load applications.

Rollers have a carbon steel roller surface and race, a Graphalloy (graphite impregnated with bronze) bearing, and a screwdriver slotted head. Mounting nut not included.

For information about track rollers, mounting, load ratings, and lubrication, see page 1114.

Quiet No-Lube Stud-Mount Track Rollers

Much quieter than their counterparts with needle and ball bearings, these rollers have sleeve bearings. They're also maintenance free with no grease to leak and no internal balls or rollers to seize. Perfect for low-speed applications with light radial loads.

All of these rollers are dimensionally interchangeable with needle-bearing rollers, such as the Long-Life Stud-Mount Track Rollers on page 1114. Mounting nut included.

***Quiet*—**Rollers have a case-hardened carbon steel roller surface and a sintered-bronze inner sleeve that's impregnated with lubrication so grease won't seep onto components. They also have a hex socket head. Maximum rpm @ no load is 1,200. Maximum temperature is 150° F.

***Ultra-Quiet*—**A fiberglass-reinforced nylon outer roller surface and a slippery smooth PTFE inner sleeve provide the quietest motion of all the rollers we offer. They're corrosion resistant, nonsparking, lightweight, and fully submersible. All have a hex socket in the stud end. The stud is Type 303 stainless steel. Mounting nut is stainless steel as well. Not rated for speed. Maximum temperature is 250° F.

Quiet (Hex Socket Head)

Ultra-Quiet (Hex Socket in Stud End)

Flange-Guided Track Rollers

Stud Mount with Single Flange (Hex Socket in Stud End)

Stud Mount with Double Flange (Hex Socket in Stud End)

Shaft Mount with Single Flange

Flanges keep rollers on their track and are great for applications that require linear alignment. All of these rollers handle high speeds and are rated for both radial load and thrust load. They're lubed for life with seals that retain lubricant and block contaminants. Maximum temperature is 225° F.

***Stud Mount*—**Have a hex socket in the stud end. They also have ball bearings, unless noted. Mounting nut included. ***Shaft Mount*—**Are steel with tapered roller bearings.

V-Groove-Guided Track Rollers

Stud Mount (Hex Socket Stud)

Shaft Mount

The 90° V-groove in these rollers provides accurate positioning and travel on any 90° angle track. Made of hardened steel, all of these rollers are lubed for life with seals that retain lubricant and block contaminants. They are also rated for thrust loads. Maximum temperature is 225° F.

Stud Mount— All have a hex socket stud and ball bearings. Mounting nut included.

Shaft Mount— All have tapered roller bearings.

Adjustable-Height V-Groove-Guided Stud-Mount Track Rollers

Fine-tune the distance between these rollers and your track by rotating the stud; it moves the roller position up and down up to 1/32". These rollers also have a 90° V-groove, which provides accurate positioning and travel on any 90° angle track.

Made of hardened steel, all of these rollers are lubed for life with seals that retain lubricant and block contaminants. They have a hex socket stud, ball bearings, and are also rated for thrust loads. Maximum temperature is 225° F. Mounting nut included.

Metric Ultra-Precision V-Groove-Guided Stud-Mount Track Rollers

Precision-ground 90° V-groove surfaces provide higher accuracy than other V-groove rollers. These rollers also have a double-row, angular-contact ball bearing design to handle both radial and thrust loads. All rollers are lubed for life with seals that retain lubricant and block contaminants. For use on any 90° angle track.

Standard rollers are for blind-hole mounting applications. Use the hex nut (N) at the stud base for tightening. ***Adjustable-height rollers*** are for through-hole mounting applications. They have an offset stud to allow for adjustment during installation. Use the hex nut (N) at the stud base for adjusting as well as tightening.

Steel Rollers— All are bearing-grade steel with a nylon ball retainer. Maximum temperature is 248° F.

Corrosion-Resistant Stainless Steel— Specially formulated grease plus Types 304 and 440C stainless steel construction make these track rollers clean-room compatible. Maximum temperature is 500° F. Mounting nut included.

90° Angle Track-Roller Rails

Use these rails with any track rollers that have a 90° V-groove. All are made of steel. **To Order:** Please specify length: 1, 2, 3, 4, 5, or 6 feet.

Hardened Steel— The contact surface has a Rockwell hardness of 58C for improved wear resistance. The bottom can be drilled for mounting.

Oil-Resistant Neoprene Idler and Drive Rollers

A neoprene rubber surface resists oil, tearing, abrasion, and heat. Durometer is 55A (see pg. 3526 for information). Temp. range is –40° to +170° F. Color is black.

Idler Rollers— Serve as guides and tensioning devices. Their roller surface is bonded to a bronze sleeve bearing that is designed to spin freely on a shaft.

Drive Rollers— Also known as contact wheels and feed rollers, drive rollers mount to a shaft to transmit power. All have an aluminum hub that is tapped for mounting with set screws, sold separately below. Their roller surface is bonded to the hub.

Precision Urethane Idler and Drive Rollers

Precision construction ensures accurate and consistent dimensions—great when tight tolerances are important. All rollers have a urethane roller surface (roller dia.) that is molded to a tolerance of ±0.003". Bore (ID) tolerance is –0.000" to +0.001". Temperature range is –40° to +180° F. Rollers are color coded by durometer: 55A is blue and 70A is orange (see page 3526 for durometer information). **To Order:** Please specify durometer: 55A or 70A.

Idler Rollers— Serve as guides and tensioning devices. Their roller surface is bonded to an SAE 841 oil-impregnated bronze sleeve bearing that is designed to spin freely on a shaft.

Drive Rollers— Also known as contact wheels and feed rollers, drive rollers mount to a shaft to transmit power. Set screws included. ***Standard-width models*** have an aluminum hub that is tapped for mounting with set screws. ***Slimline models*** have a nonprotruding aluminum hub; the set screw holes are tapped directly through the urethane roller surface to save space.

Extra-Wide Vibration-Resistant Idler and Drive Rollers

With their large footprint, these rollers minimize vibration. See page 3526 for durometer information. ***Idler Rollers—*** Serve as guides and tensioning devices. All have ball bearings and spin freely on an included stud. The stud, bearings, and nut are steel. ***Drive Rollers—*** Also known as contact wheels and feed rollers, drive rollers mount to a shaft to transmit power. All have a steel hub (unless noted) that is tapped for mounting with the included set screws.

Neoprene— Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black. **To Order:** Please specify durometer (unless noted): 20A, 35A, 60A, or 80A.

Urethane— Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color coded by durometer: 35A is yellow, 60A is blue-green, and 80A is red. **To Order:** Please specify durometer (unless noted): 35A, 60A, or 80A.

★ Aluminum hub. ● Available in 60A durometer only.

Slippery UHMW Idler Rollers

Incredibly slippery UHMW polyethylene allows materials to slide over it, so your processes keep moving even if rollers stop spinning. All rollers serve as guides and tensioning devices. They're corrosion resistant. Durometer is 68D (see page 3526 for durometer information). Temperature range is –22° to +180° F. Color is white.

All-UHMW rollers are for low loads and low speeds and are made entirely of FDA-compliant material. ***UHMW rollers with MDS-filled nylon bearing*** have higher load and speed capabilities.

Slim-Tread Drive Rollers

A narrow black Buna-N O-ring tread provides both a sure grip and a delicate touch, making these rollers perfect for light duty tasks such as those involving paper, tape, and card drives. Also known as contact wheels and feed rollers, they mount to your shaft with a set screw (included) to transmit power.

Hub is made of lightweight, white acetal and has a brass insert for added strength. Durometer is 70A (see page 3526 for durometer information). Temperature range is –30° to +250° F.

Roller Dia.	Roller Wd.	Bore (ID)	Hub Wd.	Set Screw Size		Each

Self-Cleaning Idler Rollers

A finned design keeps debris from building up and provides a soft touch to protect delicate surfaces. All of these rollers serve as guides and tensioning devices. They have ball bearings and spin freely on an included stud. The stud, bearings, and nut are steel. **To Order:** Where applicable, please specify durometer: 20A, 35A, or 60A (see page 3526 for durometer information).

Neoprene— Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black.

Urethane— Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color coded by durometer: 35A is yellow and 60A is blue-green.

One-Way Idler/Drive Rollers

Needle-roller clutch bearings allow these rollers to spin freely like idler rollers in one direction (clockwise when facing roller end), and then perform like a drive roller in the other direction. Hub, bearings, and shaft are steel. See page 3526 for durometer information.

Neoprene— Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black.

Urethane— Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color coded by durometer: 60A is blue-green, and 80A is red.

Self-Cleaning Drive Rollers

Just like the Self-Cleaning Idler Rollers on the previous page, except these are drive rollers that mount to your shaft with two set screws (included) to transmit power. Also known as contact wheels and feed rollers, they have a steel hub. **To Order:** Where applicable, please specify durometer: 35A or 60A (see page 3526 for durometer information).

Neoprene—Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black.

Urethane—Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color coded by durometer: 35A is yellow and 60A is blue-green.

Press-Fit Drive Rollers

The simple plain-bore design lets you press-fit these rollers onto a shaft without the need for set screws or keyways. Also known as contact wheels and feed rollers, they're the choice for transmitting power in low-speed, low-torque applications.

The roller surface is neoprene; it resists oil, flame, gasoline, tearing, and abrasion. Hub is aluminum. Durometer is 55A (see page 3526 for durometer information). Temperature range is –40° to +170° F. Color is black.

Large-Bore Drive Rollers

Press-fit these rollers onto your shaft or build a custom roller by adding your own hub or bushing (for bushings, see our 5926K Quick-Grip Screw-Clamp Bushings on page 1046). Also known as contact wheels and feed rollers, they transmit power. All consist of a neoprene or urethane roller surface bonded to a steel rim. See page 3526 for durometer information.

Neoprene—Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black. **To Order:** Please specify durometer: 20A, 35A, 60A, or 80A.

Urethane—Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color coded by durometer: 35A is yellow, 60A is blue-green, and 80A is red. **To Order:** Please specify durometer: 35A, 60A, or 80A.

Sure-Grip Drive Rollers

With teardrop-shaped sidewall holes and a soft surface, these rollers gently grab and maintain contact as the roller is compressed. Perfect for bottling and sheet metal applications. Also known as contact wheels and feed rollers, these rollers mount to a shaft with two set screws (included) to transmit power. Hub is made of steel. See page 3526 for durometer information.

Neoprene—Oil, flame, gasoline, and weather resistant. Temperature range is –40° to +200° F. Color is black.

Nitrile—Nonmarring with good abrasion and oil resistance. Temperature range is –60° to +175° F. Color is off-white.

Urethane—Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –65° to +200° F. Color is yellow.

Heavy Duty Drive Rollers

These sturdy rollers have steel hubs and machined keyways to handle your heavier loads. Also known as contact wheels and feed rollers, they mount to a shaft with two set screws (included) to transmit power. See page 3526 for durometer information.

Nitrile—Nonmarring with good abrasion and oil resistance. Temperature range is –20° to +180° F. Color is black.

Urethane—Nonmarring, rugged, and wear resistant, with good chemical resistance. Temperature range is –20° to +120° F. Color coded by durometer: 85A is red and 95A is maroon.

Corrosion-Resistant Turntables

Square

Round

Put a spin on your displays, industrial assemblies, and many other "lazy Susan" applications. All of these corrosion-resistant turntables have stamped plates and contain ball bearings that are housed in a large circular race. They also have a space-saving design that's only 5/16″ high. Mounting fasteners not included. ***Lubricated turntables*** provide smoother, quieter motion.

Aluminum— Lightweight aluminum plates with stainless steel ball bearings.

Galvanized Steel— Galvanized steel plates with steel ball bearings.

Black Finish— Smooth steel plates with a black finish and steel ball bearings.

Yellow Chromate— Zinc-plated steel plates with a yellow-chromate finish and stainless steel ball bearings.

Light Duty Plastic Turntables

Nothing fancy, just economical, lightweight plastic turntables with ball bearings. Use glue to keep them in place.

Solid-Surface Turntables— **To Order:** Please specify color: black, clear, or white.

Sloped Solid-Surface Turntable— Has a 9″ diameter top that slopes to a 12″ diameter base. A great choice if the base will be visible. **To Order:** Please specify color: black, clear, or white.

Offset Solid-Surface Turntable— Has a 14″ diameter top and a 9″ diameter base. Color is clear.

Ring-Style Turntables— Color is clear.

Heavy Duty Turntables

Use these rugged turntables on welding tables, industrial workstations, material container stands, and as fifth wheels on carts. All have ball bearings that ride in a precision-hardened raceway for smooth rotary motion. To mount turntable plates, weld or bolt them with standard Grade 5 or better hex-head bolts, unless noted. Mounting fasteners not included.

Lockable turntables have slotted grooves that let you lock the turntable into any of four evenly spaced positions using the included spring-loaded pull ring. ***Nonlockable turntables*** have grease fittings, unless noted.

■ No grease fittings. ▲ Use flat head screws for mounting due to limited clearance between plates.
● Has grease fittings.

Permanently Lubricated Industrial Turntables

No additional lubrication is ever needed because these turntables have fully sealed ball bearings. The top plate has a milled-flat level surface—great for welding tables and industrial assemblies. To mount turntable plates, weld or bolt them with standard hex-head bolts. Mounting fasteners not included.

Steel turntables have a steel top plate and bearings. The base is cast iron. *Turntable with open center* has a 1.25″ dia. hole through the center to allow wiring to pass through.

Stainless steel turntables have a stainless steel top plate and base. The bearings are steel.

Lockable turntables have slotted grooves that let you position the turntable into any of four evenly spaced points using the included spring-loaded pull ring. If you want the turntable to spin freely, just pull out the ring and turn the ring 90°.

Plain-Bearing and Extreme-Capacity Turntables

Plain-Bearing Turntables— Also known as slewing ring bearings, these self-lubricating bearings are maintenance free. Each has polymer plain bearings housed in aluminum rings to provide excellent vibration damping. Mounting fasteners not included.

Extreme-Capacity Turntables— By far, these have the largest load capacities of any turntables we offer. Each has steel ball bearings housed in hardened steel rings. Mount with SAE Grade 8 hex-head bolts with coarse threads (not included).

About Selecting the Right Flanged Sleeve, Sleeve, and Thrust Bearings

Also known as plain or plane bearings, these bearings allow smooth, low-friction motion between two surfaces. The load is supported through the motion of one solid surface against another.

All of these bearings are designed to handle loads: radial and/or thrust. *Radial load* is the load that is perpendicular to the shaft. *Thrust load*, also known as axial or side load, is the load that is parallel to the shaft. ***Flanged sleeve bearings*** handle both radial and thrust loads. ***Sleeve bearings*** handle radial loads. ***Thrust bearings*** handle thrust loads.

P, V, and ***PV Values—*** In addition to type of load, size, and temperature range, you'll need to know the load (***P***), velocity (***V***), and load at velocity (***PV***) values your bearing must handle. Use the formulas provided to calculate the ***P, V,*** and ***PV*** values for your application. Then compare the ***P, V,*** and ***PV*** values that you have calculated to the ***P max, V max,*** and ***PV max*** values we give for each material. If all of your values are below the maximum values listed, the bearing should work in your application.

$$P = \frac{\text{Bearing Load}}{\text{Shaft Dia.} \times \text{Bearing Lg.}}$$

The bearing load is the load on the bearing surface in pounds per square inch (psi) or Newtons per square millimeter (N/mm^2) for metric.

$$V = \text{Shaft Velocity} \times 0.262 \times \text{Shaft Dia.}$$

The shaft velocity is the velocity of the shaft surface in feet per minute (fpm) or meters per second (m/s) for metric.

$$PV = P \times V$$

Use the PV rating as a final check to ensure a bearing can sustain your combined load and velocity requirements (i.e. load at velocity).

For Example: If Bearing Load is 25 lbs., Shaft Dia. is 1/4″, Bearing Lg. is 1/2″, and Shaft Velocity is 200 rpm
Then: ***P*** = 200 psi, ***V*** = 13.1 fpm, and ***PV*** = 2620.

Bronze Flanged Sleeve Bearings

SAE 841— Also called Oilite®, this porous material is impregnated with roughly 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Graphite SAE 841—*** This porous material is impregnated with a graphite-based material, which provides low-friction dry lubrication in a wide range of temperatures. ***SAE 863—*** Also called Super Oilite®, this material is similar to SAE 841, but contains more iron for greater strength. *Note:* Color is silver because of the iron. ***Alloy 932—*** Also known as SAE 660, this nonporous, cast material makes hard, strong, and abrasion-resistant bearings with excellent resistance to shock loads (suddenly applied loads) and wear. ***Alloy 954—*** This nonporous, cast material is harder, stronger, and withstands an even wider temperature range than Alloy 932.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000
Graphite SAE 841	–30° to +700° F	1,600	1,000	40,000
SAE 863	+10° to +220° F	4,000	225	35,000
Alloy 932	–30° to +450° F	4,000	750	75,000
Alloy 954	–30° to +500° F	4,500	225	125,000

Bronze Flanged Sleeve Bearings with Certification

All of these bearings come furnished with a certificate of conformity. ***SAE 841—*** Also called Oilite®, this porous material is impregnated with 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Alloy 932—*** Also known as SAE 660, this nonporous, cast material makes hard, strong, and abrasion-resistant bearings with excellent resistance to shock loads (suddenly applied loads) and wear.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000
Alloy 932	+10° to +450° F	4,000	750	75,000

Food-Grade Oil-Lubricated Bronze Flanged Sleeve Bearings

Impregnated with oil that meets USDA H-1, these self-lubricating bearings are perfect for applications with incidental food contact. ***SAE 841—*** The oil in this porous material reduces wear. ***SAE 863—*** Also called Super Oilite® Non-Tox®, this material is similar to SAE 841 but contains more iron for greater strength. *Note:* Color is silver because of the iron.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000

PTFE/Oil-Lubricated SAE 841 Bronze Flanged Sleeve Bearings

To provide extra-slippery performance, these SAE 841 bearings are impregnated with oil that has slick PTFE particles. The oil acts as a cushion between the bearings and your shafts to add wear and shock resistance. All of these bearings are self-lubricating.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000

For information about flanged sleeve bearings, P max, V max, and PV max, see page 1126.

For tolerance information about the bearings on this page, go to mcmaster.com and search for **6391KAC**.

Ultra-Tough Oil-Lubricated Bronze Flanged Sleeve Bearings

Count on these ultra-tough bronze bearings to handle your heavily loaded applications. Made of copper with a high iron content, all are heat treated to provide excellent strength as well as wear and shock resistance. They're also impregnated with oil, which makes them self-lubricating.

Bearing Material	Temperature Range	P max	V max	PV max
Oil-Lubricated Bronze	+10° to +220° F	8,000	35	75,000

Grooved and Graphite-Filled Groove Bronze Flanged Sleeve Bearings

Grooved

Graphite-Filled Groove

Choose a bearing with an unfilled groove or one that's already filled with graphite for lubrication. All are made of Alloy 932 (also known as SAE 660), which is a nonporous cast-bronze material that is hard, strong, and abrasion resistant. It also offers excellent resistance to shock loads (suddenly applied loads) and wear.

Grooved bearings have a groove inside the bearing that retains your lubricant and provides a flow path for easy lubrication. Use high-temperature lubricants for temperatures over 250° F. ***Graphite-filled groove bearings*** have graphite in the grooves, which acts like on-board lubrication without the oily mess.

Bearing Material	Temperature Range	P max	V max	PV max
Alloy 932	+10° to +450° F	4,000	750	75,000

For Shaft Dia.	OD	Lg.	Flange OD	Flange Thick.	Grooved	Each	Graphite-Filled Groove	Each

Extra-Strength Metal-Backed Flanged Sleeve Bearings

An aluminum shell adds strength and corrosion resistance to these Frelon bearings. Made of Frelon, which is a PTFE-filled composite that's chemically inert, all of these bearings outperform bronze and plastic bearings in corrosive environments.

Size	Bearing Material	Temperature Range	P max	V max	PV max
Inch	Frelon	–400° to +400° F	3,000	300	20,000
Metric	Frelon	–400° to +400° F	20.68	1.52	0.72

Lubricated Bronze Sleeve Bearings

SAE 841— Also called Oilite®, this porous material is impregnated with 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Graphite SAE 841—*** This porous material is impregnated with a graphite-based material, which provides low-friction dry lubrication in a wide range of temperatures. ***SAE 863—*** Also called Super Oilite®, this material is similar to SAE 841 but contains more iron for greater strength. *Note:* Color is silver because of the iron.

Bearing Material	Temperature Range	P max	V max	PV max

***SAE 841*—**Also called Oilite®, this porous material is impregnated with 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Graphite SAE 841*—**This porous material is impregnated with a graphite-based material, which provides low-friction dry lubrication in a wide range of temperatures. ***SAE 863*—**Also called Super Oilite®, this material is similar to SAE 841, but contains more iron for greater strength. *Note:* Color is silver because of the iron.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000
Graphite SAE 841	–30° to +700° F	1,600	1,000	40,000
SAE 863	+10° to +220° F	4,000	225	35,000

Cast Bronze Sleeve Bearings

Alloy 932— Also known as SAE 660, this nonporous, cast material makes hard, strong, and abrasion-resistant bearings with excellent resistance to shock loads (suddenly applied loads) and wear.

Alloy 954— This nonporous, cast material is harder, stronger, and withstands an even wider temperature range than Alloy 932.

Bearing Material	Temperature Range	P max	V max	PV max
Alloy 932	–350° to +450° F	4,000	750	75,000
Alloy 954	–350° to +500° F	4,500	225	125,000

Sleeve Bearings

For information about sleeve bearings, P max, V max, and PV max, see page 1126.

For tolerance information about the bearings on this page, go to mcmaster.com and search for **6391KAC.**

Food-Grade Oil-Lubricated SAE 841 and SAE 863 Bronze Sleeve Bearings

Impregnated with oil that meets USDA H-1, these bearings are perfect for applications with incidental food contact.

SAE 841— Also called Oilite® Non-Tox®, the oil in this porous material reduces wear. ***SAE 863—*** Also called Super Oilite® Non-Tox®, this material is similar to SAE 841 but contains more iron for greater strength. *Note:* Color is silver because of the iron.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	–40° to +350° F	2,000	1,200	50,000
SAE 863	–40° to +350° F	4,000	225	35,000

Ultra-Tough Oil-Lubricated Bronze Sleeve Bearings

Count on these ultra-tough bronze bearings to handle your heavily loaded applications. Made of copper with a high iron content, all are heat treated to provide excellent strength as well as wear and shock resistance. They are also impregnated with oil.

Bearing Material	Temperature Range	P max	V max	PV max
Oil-Lubricated Bronze	+10° to +220° F	8,000	35	75,000

PTFE/Oil-Lubricated SAE 841 Bronze Sleeve Bearings

To provide extra-slippery performance, these SAE 841 bearings are impregnated with oil that has slick PTFE particles. The oil acts as a cushion between the bearings and your shafts to add wear and shock resistance.

Bearing Material	Temperature Range	P max	V max	PV max
PTFE/Oil-Lubricated SAE 841 Bronze	+10° to +220° F	2,000	1,200	50,000

Metric Bronze Sleeve Bearings

SAE 841— Also called Oilite® M-Series®, this porous material is impregnated with 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Alloy 932—*** Also known as SAE 660, this nonporous, cast material makes hard and strong bearings with excellent resistance to shock loads (suddenly applied loads) and wear.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	+10° to +220° F	2,000	1,200	50,000
Alloy 932	–350° to +450° F	4,000	750	75,000

For information about sleeve bearings, P max, V max, and PV max, see page 1126.

For tolerance information about the bearings on this page, go to mcmaster.com and search for **6391KAC**.

Grooved and Graphite-Filled Bronze Sleeve Bearings

Figure-8 Grooved— A figure-8-shaped groove inside these bearings retains your lubricant and provides a flow path for easy relubrication. Use high-temperature lubricants for temperatures over 250° F.

Graphite Filled— Graphite-filled grooves and plugs act like on-board lubrication without the oily mess. *Graphite-filled grooved bearings* have a figure-8-shaped groove that provides lubrication on the inside of the bearing. *Graphite-filled plugged bearings* are plugged completely through the bearing wall to provide lubrication on both the inside and outside of the bearing.

Alloy 932 and ***Alloy 954—*** Hard, strong, and abrasion resistant, these nonporous cast-bronze materials make bearings with excellent resistance to shock loads (suddenly applied loads) and wear. *Alloy 932* is also known as SAE 660. *Alloy 954* is harder, stronger, and withstands an even wider temperature range than Alloy 932.

Figure-8 Grooved — *Graphite-Filled Grooved* — *Graphite-Filled Plugged*

Bearing Material	Temperature Range	P max	V max	PV max
Alloy 932	–350° to +450° F	3,500	560	56,000
Alloy 954	–350° to +500° F	3,900	169	93,750

Extreme-Environment No-Lube Sleeve Bearings

Talk about extreme environments, these bearings handle temperatures from –450° to +750° F, even under water. They also conduct current. All are made of solid graphalloy—a mixture of graphite, a dry lubricant that reduces wear, and copper, which adds strength, durability, and heat-dissipating qualities. The graphite eliminates the need for messy oil and makes these bearings great for hard-to-lubricate areas.

Bearing Material	Temperature Range	P max	V max	PV max
Graphalloy	–450° to +750° F	750	75	12,000

Vibration-Damping Bronze Sleeve Bearings

With a flexible layer of neoprene rubber sandwiched between a protective steel shell and an SAE 841 bronze insert, these bearings quiet down equipment by absorbing vibration. The neoprene rubber also allows these bearings to accommodate shaft misalignment and adds resistance to shock loads (suddenly applied loads). The bronze insert, which is impregnated with 20% SAE 30 oil, makes them great for hard-to-lubricate areas.

Material	Temp. Range	P max	V max	PV max

Extra-Strength Metal-Backed Sleeve Bearings

A metal shell adds strength to these bearings.

Steel-Backed PTFE-Coated Bronze—These bearings have a steel shell and a bronze lining, which is coated with a thin layer of low-friction PTFE. They resist corrosion and water absorption and are electrically conductive. They also have the highest load capacity of our metal-backed bearings and are well suited for rotary and oscillating motion.

Aluminum-Backed Frelon—These bearings have an aluminum shell and a Frelon lining, which is a PTFE-filled composite that's chemically inert. They outperform bronze and plastic bearings in corrosive environments.

Size	Temperature Range	P Max	V max	PV max

Mil.-Spec. PTFE-Lined Sleeve Bearings

Designed to meet MIL-B-81934 (SAE-AS81934), these maintenance-free bearings are heat-treated 17-4 PH stainless steel with a PTFE fiber liner. The liner also meets MIL-B-81820 (SAE-AS81820).

All of these bearings offer excellent resistance to most chemical solvents. They have inherent damping qualities that reduce noise. Great for use in applications with shock loads (suddenly applied loads) and vibration.

Bronze Thrust Bearings

SAE 841— Also called Oilite®, this porous material is impregnated with 19% SAE 30 oil. The oil reduces wear as well as required maintenance. ***Graphite SAE 841—*** This porous material is impregnated with a graphite-based material, which provides low-friction dry lubrication in a wide range of temperatures. ***SAE 863—*** Also called Super Oilite®, this material is similar to SAE 841 but contains more iron for greater strength. *Note:* Color is silver because of the iron. ***Alloy 932—*** Also known as SAE 660, this nonporous, cast material makes hard, strong, and abrasion-resistant bearings with excellent resistance to shock loads (suddenly applied loads) and wear. ***Alloy 954—*** This nonporous, cast material is harder, stronger, and withstands an even wider temperature range than Alloy 932.

Plugged bearings have evenly spaced holes filled with graphite plugs, which act like on-board lubrication without the oily mess.

Food-Grade Oil-Lubricated Bronze Thrust Bearings

Impregnated with oil that meets USDA H-1, these bearings are perfect for applications with incidental food contact. ***SAE 841—*** Also called Oilite® Non-Tox®, the oil in this porous material reduces wear. ***SAE 863—*** Also called Super Oilite® Non-Tox®, this material is similar to SAE 841 but contains more iron for greater strength. *Note:* Color is silver because of the iron.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841	–40° to +350° F	2,000	1,200	50,000
SAE 863	–40° to +350° F	4,000	225	35,000

Ultra-Tough Oil-Lubricated Bronze Thrust Bearings

Count on these ultra-tough bronze bearings to handle your heavily loaded applications. Made of copper with a high iron content, all are heat treated to provide excellent strength as well as wear and shock resistance. They are also impregnated with oil.

Bearing Material	Temperature Range	P max	V max	PV max
Oil-Lubricated Bronze	+10° to +220° F	8,000	35	75,000

PTFE/Oil-Lubricated SAE 841 Bronze Thrust Bearings

To provide extra-slippery performance, these SAE 841 bearings are impregnated with oil that has slick PTFE particles. The oil acts as a cushion between the bearings and your shafts to add wear and shock resistance.

Bearing Material	Temperature Range	P max	V max	PV max
PTFE/Oil-Lubricated SAE 841 Bronze	+10° to +220° F	2,000	1,200	50,000

Plastic Flanged Sleeve Bearings

***Nylon*—**A reasonably slippery, rigid, and abrasion-resistant material that handles light jobs without the need for lubrication.

***MDS-Filled Nylon*—**The same qualities as nylon combined with wear-resistant molybdenum disulfide (MDS).

***UHMW*—**Ultra-high molecular weight (UHMW) polyethylene is USDA approved and FDA compliant. It withstands wet, corrosive environments.

***Acetal*—**An economical alternative to PTFE, this material is not only strong, but also resistant to chemicals and moisture.

***PTFE*—**Has the lowest coefficient of friction of all our materials, so it's ultra-slippery. It also offers excellent chemical resistance and performs well at extreme temperatures.

Bearing Material	Temperature Range	P max	V max	PV max
Nylon	–20° to +250° F	400	360	3,000
MDS-Filled Nylon	–40° to +176° F	2,901	118	3,400
UHMW	–200° to +180° F	1,000	100	2,000
Acetal	–20° to +180° F	1,000	1,000	2,700
PTFE	–350° to +500° F	500	100	1,000

High-Performance Plastic Flanged Sleeve Bearings

***Rulon*—**This reinforced PTFE material doesn't absorb water. *Rulon 641* is nontoxic and FDA compliant; excellent for food applications. *Rulon J* offers the lowest coefficient of friction of any reinforced PTFE material and is great for start/stop applications. *Rulon LR* is resistant to most chemicals. ***PEEK*—**Compatibility with a wide range of chemicals and high load capacity make this an economical alternative to Vespel® polyimide in lower speed situations. It's also the choice for high-pressure steam applications. ***Vespel® Polyimide*—**Our highest performing plastic material. It offers excellent chemical resistance.

Bearing Material	Temperature Range	P max	V max	PV max

Plastic Sleeve Bearings

***Nylon*—**A reasonably slippery, rigid, and abrasion-resistant material that handles light jobs without the need for lubrication.

***MDS-Filled Nylon*—**The same qualities as nylon combined with wear-resistant molybdenum disulfide (MDS).

***UHMW*—**Ultra-high molecular weight (UHMW) polyethylene is USDA approved and FDA compliant. It withstands wet, corrosive environments.

***Acetal*—**An economical alternative to PTFE, this material is not only strong, but also resistant to chemicals and moisture.

***PTFE*—**Has the lowest coefficient of friction of all our materials, so it's ultra-slippery. It also offers excellent chemical resistance and performs well at extreme temperatures.

Bearing Material	Temperature Range	P max	V max	PV max
Nylon	–20° to +250° F	400	360	3,000
MDS-Filled Nylon	–40° to +176° F	2,901	118	3,400

● Temp. range is –40° to +212° F; P max is 300; V max is 60; PV max is 3,000.

For information about sleeve bearings, P max, V max, and PV max, see page 1126.

ⓘ For tolerance information about the bearings on this page, go to mcmaster.com and search for **6389KAC**.

High-Performance Plastic Sleeve Bearings

Glass-Filled PTFE— Just like standard PTFE, this PTFE material has a low coefficient of friction and is very chemical resistant. The glass filling increases its load and speed capabilities.

Rulon— This reinforced PTFE material doesn't absorb water. *Rulon 641* is nontoxic and FDA compliant; excellent for food applications. *Rulon J* offers the lowest coefficient of friction of any reinforced PTFE material and is great for start/stop applications. *Rulon LR* is resistant to most chemicals.

PEEK— Compatibility with a wide range of chemicals and high load capacity make this an economical alternative to Vespel® polyimide in lower speed situations. It's also the choice for high-pressure steam applications.

Vespel® Polyimide— Our highest performing plastic material. It offers the chemical resistance of glass-filled PTFE with a wider temperature range.

Bearing Material	Temperature Range	P max	V max	PV max
Glass-Filled PTFE	–350° to +500° F	1,000	400	11,000
Rulon 641	–400° to +550° F	1,000	400	10,000
Rulon J	–400° to +550° F	750	400	7,500
Rulon LR	–400° to +550° F	1,000	400	10,000
PEEK	–148° to +480° F	8,500	400	3,500
Vespel® Polyimide	–400° to +550° F	4,900	3,000	300,000

★ P max is 21,750; V max is 295; PV max is 37,700.

Self-Lubricating Fiberglass Sleeve Bearings

Able to tolerate heavy shock loads and wet, corrosive environments, these lightweight bearings also dampen vibration and minimize damage to your shafts and housings. They have a multilayer epoxy fiberglass shell and PTFE/Nomex composite lining. The lining has a smooth braided-look finish and requires no lubrication. Great for high-load, low-speed applications.

Bearing Material	Temperature Range	P max	V max	PV max
PTFE/Nomex-Lined Fiberglass Composite	–212° to +320° F	20,000	150	34,300

Metric Plastic Sleeve Bearings

UHMW—Ultra-high molecular weight (UHMW) polyethylene is USDA approved and FDA compliant. It withstands wet, corrosive environments.
Acetal—An economical alternative to PTFE and Rulon, this material is not only strong, but also resistant to chemicals and moisture.
PTFE—Has the lowest coefficient of friction of all our materials, so it's ultra-slippery. It also offers excellent chemical resistance and performs well at extreme temperatures.
Rulon LR—This reinforced PTFE material doesn't absorb water and resists most chemicals.

Bearing Material	Temperature Range	P max	V max	PV max
UHMW	–200° to +180° F	1,000	100	2,000
Acetal	–20° to +180° F	1,000	1,000	2,700
PTFE	–350° to +500° F	500	100	1,000
Rulon LR	–400° to +550° F	1,000	400	10,000

Plastic Thrust Bearings

Nylon—A reasonably slippery, rigid, and abrasion-resistant material that handles light jobs without the need for lubrication.
UHMW—Ultra-high molecular weight (UHMW) polyethylene is FDA compliant. It withstands wet, corrosive environments.
Acetal—An economical alternative to PTFE and Rulon, this material is not only strong, but also resistant to chemicals and moisture.
PTFE—Has the lowest coefficient of friction of all our materials, so it's ultra-slippery. It also offers excellent chemical resistance and performs well at extreme temperatures.
Rulon—This reinforced PTFE material doesn't absorb water. *Rulon 641* is nontoxic and FDA compliant; excellent for food and medical applications. *Rulon J* offers the lowest coefficient of friction of any reinforced PTFE material and is great for start/stop applications. *Rulon LR* is resistant to most chemicals.

Bearing Material	Temperature Range	P max	V max	PV max
Nylon	–20° to +212° F	400	360	3,000
UHMW	–100° to +180° F	1,000	50	2,000

Nylon Snap-In Thrust Bearings

Easily snap these thrust bearings into a variety of thin sheet materials. A gap in the side makes it simple to press them into place and also allows them to expand if they heat up or absorb moisture. The smaller of the two flanges fits into the mounting hole and holds the bearing in place; the larger flange is big enough to handle thrust loads. Made of nylon, all of these bearings require no lubrication and are resistant to many chemicals. ***MDS-filled nylon*** contains wear-resistant molybdenum disulfide (MDS).

About Rolling-Element Bearings

Rolling-element bearings support loads using balls or rollers. Since they operate with less friction than plain bearings, they're often called antifriction bearings. Load and speed (rpm) values help you compare bearings.

Load is the dynamic rating for the radial (perpendicular to the shaft) load (unless noted) a bearing can withstand for one million revolutions.

Note: Tolerance information about all of our bearings can be found in the CAD drawings.

ABEC (Annular Bearing Engineers Committee) rated bearings meet industry accepted dimensional tolerances for precision. The higher the ABEC number, the more precise the bearing.

For ABEC tolerances, go to mcmaster.com and search for **60355KAC.**

Ball bearings are the choice for higher speeds and light to moderate loads. Since the balls make less contact with the raceways than the rollers in roller bearings, friction is lessened, which makes higher speeds possible.

Roller bearings generally support higher loads than ball bearings because the rollers make greater surface contact with raceways. There are three styles of roller bearings:

1) Spherical— A spherically shaped outer race increases surface contact with rollers, which boosts load capacity and accommodates misalignment. Spherical roller bearings handle high radial loads as well as a combination of radial and thrust loads.

2) Tapered— Cone-shaped rollers handle high radial loads, thrust loads, or both. They tolerate shock loads (suddenly applied loads) and minor shaft misalignment and are suitable for low to high speeds.

3) Needle— Longer and thinner than cylindrical bearings, needle bearings can carry high loads for their small size.

For technical drawings and 3-D models, go to mcmaster.com.

Ball Bearings

Steel Ball Bearings

Open

Flanged Open

Double Shielded

Double Sealed

Flanged Double Sealed

Count on solid performance from these steel ball bearings. Temperature range is –20° to +250° F. Maximum speed is 1200 rpm for open bearings; 2500 rpm for all others (unless noted). These bearings are not ABEC rated.

Open bearings run cool and are easy to lubricate.

Double-shielded bearings have steel shields that block out dirt. They come greased.

Double-sealed bearings have Buna-N seals (unless noted) that block out dirt, preserve lubricants, and reduce noise. They come greased.

Flanged bearings are easy to install; the flange provides a stop for quick positioning.

Stainless Steel Ball Bearings

Made of Type 316 stainless steel, these highly corrosion-resistant bearings are excellent for use in frequent washdown and caustic environments. All are open bearings, which means they run cool and are easy to lubricate. They have a polymer ball cage that withstands temperatures from –40° to +140° F.

Lubrication-Free Acetal Ball Bearings

With no need for lubrication because of the acetal plastic construction, you'll experience less downtime for maintenance. All of these bearings are lighter, quieter, smoother running, and more corrosion resistant than conventional metal bearings. They are open bearings, which means they run cool. Temperature range is –40° to +180° F.

All of the balls are nonmagnetic and provide electrical insulation. ***Stainless steel balls*** offer excellent corrosion resistance. ***Glass balls*** offer even more corrosion resistance than stainless steel balls.

High-Load Steel Ball Bearings

Open

Double Shielded

Double Sealed

Double Sealed with Retaining Ring

Trust these ball bearings to perform well in your most demanding applications. Temperature range is –20° to +250° F.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have synthetic rubber seals (unless noted) that block out dirt, preserve lubricants, and reduce noise. They come greased.

High-Load/High-Speed Bearings— Are available with a retaining ring, which holds the bearing in the housing.

High-Speed/High-Load Steel Ball Bearings with Shaft Collar Mount

Great for high speeds and high loads, these bearings have an extended inner ring that acts as a built-in shaft collar to save you time and space when mounting. All are double sealed with synthetic rubber seals that block out dirt, preserve lubricants, and reduce noise. They also have a retaining-ring groove. Temperature range is –20° to +250° F. Two set screws for secure mounting are included.

Available with and without a retaining ring, which holds the bearing in the housing.

Extended-Ring Steel Ball Bearings

With an extended inner ring and two knurled-cup set screws, it's easy to securely install these bearings. All are double-sealed with synthetic rubber seals that block out dirt, preserve lubricants, and reduce noise. They also have two holes for adding lubrication. Bearings are 52100 alloy steel with a corrosion-resistant black-oxide finish. Temperature range is –20° to +250° F.

Metric Steel Ball Bearings—ABEC-1

Open

Double Shielded

Double Sealed

Made to meet ABEC-1 dimensional tolerance standards, these quiet-running, electric-motor-quality bearings handle radial (perpendicular to the shaft) loads and small amounts of angular misalignment. Temperature range is –22° to +230° F.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have Buna-N seals that block out dirt, preserve lubricants, and reduce noise. They come greased.

Steel Ball Bearings—ABEC-1

Open

Double Shielded

Double Sealed

Made to meet ABEC-1 dimensional tolerance standards in hard-to-find inch sizes, these quiet-running, electric-motor-quality bearings handle radial (perpendicular to the shaft) loads and small amounts of angular misalignment. Temperature range is –40° to +248° F.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have Buna-N seals that block out dirt, preserve lubricants, and reduce noise. They come greased.

Stainless Steel Ball Bearings—ABEC-1

Open

Double Shielded

Double Sealed

Strength is combined with corrosion resistance in these Type 440 stainless steel bearings. Made to meet ABEC-1 dimensional tolerance standards, all are quiet-running, electric-motor-quality bearings. They can handle radial (perpendicular to the shaft) loads and small amounts of angular misalignment. Temperature range is –40° to +300° F.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have Buna-N seals (except for 6153K69, which has PTFE) that block out dirt, preserve lubricants, and reduce noise. They come greased.

High-Capacity Steel Ball Bearings—ABEC-1

Open

Double Shielded

Double Sealed

Able to support higher radial (perpendicular to the shaft) loads, these bearings have two rows of balls, which are held at 25° contact angles. They're all made to meet ABEC-1 dimensional tolerance standards. Temperature range is –4° to +250° F, unless otherwise stated.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have Buna-N seals that block out dirt, preserve lubricants, and reduce noise. They come greased and have a temperature range of –4° to +230° F.

For information about ball bearings, see page 1141.

Precision-Plus Steel Ball Bearings—ABEC-1

While designated as ABEC-1, these bearings are actually made to higher-precision ABEC-3 dimensional tolerance standards. All are quiet-running, electric-motor-quality bearings that can handle radial (perpendicular to the shaft) loads and small amounts of angular misalignment. Temperature range is 0° to +230° F for inch sizes; –40° to +212° F for metric sizes.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have steel shields that block out dirt. They come greased. ***Double-sealed bearings*** have nitrile seals that block out dirt, preserve lubricants, and reduce noise. They come greased.

Self-Aligning High-Capacity Steel Ball Bearings—ABEC-1

A sphere-shaped raceway and two rows of balls give these bearings a high load capacity and the ability to compensate for shaft misalignment. All are made to ABEC-1 dimensional tolerance standards. Temperature range is –40° to +212° F.

Open bearings run cool and are easy to lubricate. ***Double-sealed bearings*** have steel-reinforced Buna-N seals that block out dirt, preserve lubricants, and reduce noise. They come greased.

Perma-Lube Ball Bearings—ABEC-1

Open

Double Sealed

A solid polymer lubricant fills the space between the balls and the race, virtually eliminating the need for additional lubrication. Because it's solid, the lubricant blocks out water and dust, extending the life of the bearings. All bearings are made to ABEC-1 dimensional tolerance standards. They can handle radial (perpendicular to the shaft) loads and small amounts of angular misalignment. Temperature range is 10° to 200° F for bearings with solid polymer grease; –40° to +210° F for bearings with FDA-grade solid polymer grease.

Open bearings run cool. ***Double-sealed bearings*** have Buna-N seals that block out dirt, preserve lubricants, and reduce noise.

Type 440 Stainless Steel—Offers good corrosion resistance. *Bearings with FDA-grade solid polymer grease* are the choice for food-related applications.

Clean-Wearing Steel Ball Bearings—ABEC-1

Open

Double Shielded

An ultra-thin film coating reduces metal particles generated from normal wear, acts as a lubricant, and adds corrosion resistance. Great for clean room as well as semiconductor manufacturing environments. Temperature range is –40° to +248° F.

Open bearings run cool and are lubricated with a solid fluorocarbon polymer film. ***Double-shielded bearings*** have steel shields that block out dirt and are lubricated with Demnum LR200 film.

For information about ball bearings, see page 1141.

Ultra-Thin Multi-Load Steel Ball Bearings—ABEC-1F

A unique internal construction contacts the balls at four points enabling these bearings to resist any combination of radial (perpendicular to the shaft), thrust (parallel to the shaft), and moment (torque-type forces off the radial and thrust planes) loads. Their ultra-thin design is perfect for space-restricted areas. They allow the use of larger-diameter hollow shafts that can hold air and hydraulic lines, electrical wiring, and other components, resulting in neater, more efficient system design.

All of these bearings are open bearings, which means they run cool and are easy to lubricate. They're made to ABEC-1F dimensional tolerance standards. Temperature range is –65° to +250° F. Bearings also meet ABMA standard 26.2.

Note: Maximum rpm listed is for radial, thrust, or combined loads and is based on lubrication with grease.

High-Precision One-Way Locking Steel Ball Bearings—ABEC-3

Also called ball bearing clutches, these high-precision bearings have internal locking elements (sprags) that lock to transmit torque in one direction while they turn freely in the other direction. Superb for indexing, overrunning, and backstopping applications.

All of these bearings are shielded (unless noted), which means they have shields that block out dirt. They are made to ABEC-3 dimensional tolerance standards and come filled with grease. You can use them as drop-ins for popular-sized ball bearings. Temperature range is –40° to +175° F.

Bearing No.	For Shaft Dia., mm	OD, mm	Wd., mm	Torque, ft.-lbs.	Dynamic Load Cap., lbs.	Max. rpm		Each

● Bearing has one shielded side and one sealed side.

Dual-Load Angular-Contact Steel Ball Bearings—ABEC Rated

The 40° contact angle of these ball bearings enables them to accept combined radial (perpendicular to the shaft) and thrust (parallel to the shaft) loads. They handle relatively high speeds and have a polyamide ball cage.

Open bearings run cool and are easy to lubricate. They meet high-precision ABEC-3 dimensional tolerance standards. Temperature range is –40° to +250° F. ***Double-sealed bearings*** have rubber seals that block out dirt, preserve lubricants, and reduce noise. They meet ABEC-1 dimensional tolerance standards. Temperature range is –22° to +230° F.

Miniature High-Precision Stainless Steel Ball Bearings—ABEC-5

Open

Double Shielded with Extended Inner Ring

Flanged Open

Made to tight tolerances, these bearings meet ABEC-5 dimensional tolerance standards and are sized just right for small spaces. All are quiet-running bearings that can handle radial (perpendicular to the shaft) loads in low-friction applications at low operating torque. They're made of Type 440C stainless steel for high strength and excellent corrosion resistance. All are lubricated. Temperature range is –65° to +250° F.

Open bearings run cool and are easy to lubricate. ***Double-shielded bearings*** have Type 300 series stainless steel shields that block out dirt. *Double-shielded bearings with extended inner ring* let you mate the inner ring with a shaft collar so the collar doesn't touch moving parts.

Flanged bearings are easy to install; the flange provides a stop for quick positioning.

For information about ball and roller bearings, see page 1141.

Ultra-Precision Miniature Stainless Steel Ball Bearings—ABEC-7

These tiny ball bearings are made to ABEC-7 dimensional tolerance standards and are the most precise miniature bearings we offer. All are quiet-running bearings. They can handle radial (perpendicular to the shaft) loads and are best suited for low-torque, high-speed applications. All are made of Type 440C stainless steel for high strength and corrosion resistance.

Open bearings run cool and are easy to lubricate. Temperature range is –13° to +248° F. ***Double-shielded bearings*** have steel shields that block out dirt. Temperature range is –65° to +250° F. They come greased.

Flanged bearings are easy to install; the flange provides a stop for quick positioning. They come greased.

Ultra-Precision Angular-Contact Steel Ball Bearings—ABEC-7

Also known as machine tool spindle bearings, these 15° contact angle bearings are made to super-tight ABEC-7 dimensional tolerance standards and can handle very high speeds. They are often mounted in pairs (external surfaces are precision finished) for increased load-handling capabilities. All bearings are open bearings, which means they run cool and are easy to lubricate. They have a phenolic ball cage. Maximum temperature is 140° F.

Bearing No.	For Shaft Dia., mm	OD, mm	Wd., mm	Dynamic Load Cap., lbs.	Max. rpm		Each

High-Load Steel Spherical Roller Bearings

Two rows of spherically shaped rollers give these bearings dynamic load carrying capabilities up to four times that of comparably sized ball bearings. They handle heavy shock (suddenly applied) loads and moderate thrust (parallel to the shaft) loads. All bearings are open bearings, which means they run cool. They have a hole in the outer ring for easy lubrication. Perfect for metal milling machinery, mining and oil field equipment, pumps, and compressors. Maximum temperature is 390° F.

Steel Tapered-Roller Bearings

Inner Ring and Roller Assembly

Outer Ring

Complete Bearing

Also known as Timken bearings, these tapered-roller bearings handle both radial (perpendicular to the shaft) and thrust (parallel to the shaft) loads, so you can use them virtually anywhere wheels and shafts turn. They have a two-piece design, which offers easy assembly and more accurate adjustments. A complete bearing consists of an inner ring and roller assembly plus an outer ring (sold separately). For best results, replace the outer ring whenever you change the inner ring and roller assembly. All components are made to Class 2 tolerances. Temperature range is –65° to +200° F.

For information about roller bearings, see page 1141.

Steel Needle-Roller Bearings

Needle rollers provide increased load capacity, and without an inner race, they're extremely thin and economical. Also known as drawn-cup bearings, the shell is drawn out to form a lip that holds the bearing together. A large grease reservoir means they'll need lubrication less often. Use these bearings on hardened and ground shafts. All are slightly oversized for a snug fit; press fit to install. Temperature range is –13° to +250° F for open bearings; –4° to +212° F for sealed bearings.

Open bearings run cool and are easy to lubricate. ***Single-sealed bearings*** have a rubber seal on one side that blocks out dirt and preserves lubricants. ***Double-sealed bearings*** have rubber seals on both sides that block out dirt and preserve lubricants. They come greased.

Single Sealed

High-Precision Steel Needle-Roller Bearings

Made of steel and precision ground, these bearings give you higher load capacity, speed, and accuracy than the Steel Needle-Roller Bearings. They're for use on hardened and ground shafts. If your shaft is not hardened and ground, use these bearings with the optional liners (sold separately). Just insert a liner into the bearing and press fit onto a shaft. All bearings have a lubrication groove and hole, except for 2423K21 and 2423K22.

Open bearings run cool and are easy to lubricate. Temperature range is –4° to +250° F. ***Double-sealed bearings*** have rubber seals that block out dirt and preserve lubricants. Temperature range is –30° to +250° F. ***Optional liners*** are made of hardened and ground steel. *Inch sizes* have a lubrication hole; *metric sizes* do not, except for 2423K48.

One-Way Locking Steel Needle-Roller Bearings

Also known as drawn-cup roller clutches, these bearings roll freely in one direction, but they lock to transmit torque when the rotation of the shaft is reversed. An arrow on the lip indicates the rotational direction that locks the bearings. These bearings do not support radial (perpendicular to the shaft) loads. If radial loads are present, use these bearings with Steel Needle-Roller Bearings. All are for use on hardened and ground shafts. They have a steel shell and a cage to hold the rollers in place.

Inch—*Bearings with plastic ball cage* have a maximum temperature of 200° F. *Bearings with glass-fiber reinforced nylon ball cage* are longer lasting and have a maximum temperature of 250° F. ***Metric—***Temperature range is 14° to 158° F.

One-Piece Steel Thrust Ball Bearings

No need to mate cage assemblies and washers—these bearings are fastened together, so they're easy to handle and install. Great for heavy duty thrust (parallel to shaft) loads on pump valves, machine spindles, drilling heads, and rotary and index tables. All bearings are made of hardened steel. Raceways are grooved and machined. Temperature range is –40° to +250° F. *Note:* Dynamic load capacities listed are for thrust loads.

Open—These bearings run cool and are easy to lubricate. They have a unique design, which allows your shaft to sit on top of the bearing rather than being inserted through it. They also have oversized balls that run slower, which reduces friction and extends bearing life. Thick washers with deeply grooved raceways increase load carrying capacity. You can use these open bearings as miniature high-precision turntables that handle both heavy loads and speeds up to 1,500 rpm. Turntables can be bonded to a mounting plate or press-fit into a hole.

Shielded—A steel outer band holds these bearings together and acts as a shield, blocking out dirt and preserving lubricants. The band has an oil hole to facilitate lubrication. Without a ball cage, these bearings hold more balls than standard three-piece thrust bearings.

Steel Thrust Ball Bearings

When you don't need high-precision machined bearings, these three-piece bearings are an economical option. Bearings include two washers and a nylon cage with balls. Maximum speed is 2500 rpm. Temperature range is –40° to +225° F. *Note:* Dynamic load capacities listed are for thrust (parallel to the shaft) loads.

Bearings with stainless steel washers are made of Type 410 stainless steel with Type 440C balls—great for corrosive environments.

High-Performance Steel Thrust Ball Bearings

Count on superior performance from these bearings. Each three-piece bearing includes two washers and a ball cage. *Note:* Dynamic load capacities listed are for thrust (parallel to the shaft) loads.

Miniature—These tiny thrust bearings are great for space-restricted, low-friction applications. Washers are chrome-plated steel; ball cage is bronze. Temperature range is –65° to +250° F.

Standard—With grooved raceways and thicker construction, these hardened steel bearings handle greater loads than the miniature bearings above. They have a steel cage, except 6681K11, which has a nylon cage. Temperature range is –40° to +248° F.

Steel Thrust Needle-Roller Bearings

Because of the large contact area between the rollers and washers, these bearings are great for medium to heavy duty, low-friction jobs. Their compact, low-profile design works well in narrow spaces. A complete bearing consists of one cage assembly and two washers (sold separately). For an even lower profile, you can use cage assemblies without washers on material that is hardened to Rockwell C58-C64 with a surface finish of 16 microns.

All components are made of steel. Temperature range is –40° to +248° F for inch sizes; –4° to +248° F for metric sizes. *Note:* Dynamic load capacities listed are for thrust (parallel to shaft) loads.

Food-Grade Stainless Steel Mounted Ball Bearings—ABEC-1

Base Mount

Flange Mount

Square-Flange Mount

With their corrosion-resistant stainless steel construction and smooth surfaces that won't trap debris, these are the ultimate bearings for use in food-handling equipment that is frequently washed down. Bases are solid cast 300 series stainless steel. Ball bearings are deep grooved and made of Type 420C stainless steel. They're permanently lubricated with USDA-approved grease and double shielded—so they're virtually maintenance free. Shields block out dirt and are made of Type 304 stainless steel.

All bearings are made to ABEC-1 dimensional tolerance standards. Temperature range is –30° to +160° F. Furnished with two stainless steel set screws to secure the bearing to the shaft.

Cast Iron Mounted Steel Ball Bearings—ABEC-1

These rugged cast iron bearings have a convenient grease fitting for easy lubrication through the housing. All are made to ABEC-1 dimensional tolerance standards and have a double-sealed, deep-grooved ball bearing insert. Ball bearing components are steel; they can accommodate 2° of shaft misalignment. Temperature range is –4° to +248° F.

Bearings with set-screw lock include two set screws to secure the bearing to the shaft. ***Bearings with eccentric lock*** have a collar with a low-center shaft opening that wedges against the shaft as it turns—gripping in one direction and releasing in the other. A set screw is included for gripping back-up.

Also Available: Replacement ball bearing inserts. Please ask for 6361K888 and specify the part number of the bearing for which you need an insert.

Nickel-Plated Cast Iron Mounted Steel Ball Bearings—ABEC-1

A nickel-plated cast iron housing makes these mounted ball bearings corrosion resistant and extremely durable. The housing also has a grease fitting to simplify lubrication. Great for washdown applications.

All of these bearings are made to ABEC-1 dimensional tolerance standards and accommodate 1.5° of shaft misalignment. Bearing inserts are deep grooved and double sealed to block out dirt and preserve lubricants. Components are steel. Temperature range is –4° to +212° F, except for chevron-flange-mount bearings, which have a temperature range of –40° to +225° F. Furnished with two set screws to secure the bearing to the shaft.

Permanently Lubricated Cast Iron Mounted Steel Ball Bearings—ABEC Rated

With permanent lubrication, these bearings save maintenance time and are perfect for use in hard-to-reach areas. They come lubricated with USDA-approved H1 lubricant so they are a good choice for food-service applications. Housing is cast iron. Bearing inserts are steel. Furnished with two set screws to secure the bearing to the shaft.

With USDA H1 Solid Polymer-Polyethylene Grease—Made to ABEC-3 dimensional tolerance standards with sealed bearing inserts to block out dirt. USDA H1 lubricant is solid and long-wearing so it won't leak out of the bearing. Temperature range is 5° to 212° F.

With USDA H1 Food-Grade Oil—Made to ABEC-1 dimensional tolerance standards with shielded bearing inserts to block out dirt. USDA H1 oil is permanently sealed into the bearing. The housing has a corrosion-resistant coating. Temperature range is –30° to +250° F.

For information about ball bearings, see page 1141.

High-Speed Cast Iron Mounted Steel Ball Bearings—ABEC-1

Often called air-handling bearings, these bearings stand up to the ultra-high-speed demands of high-speed blowers and fans. They have the highest speed capability of any mounted ball bearing we offer. All are made to ABEC-1 dimensional tolerance standards. They're double shielded and have low-friction seals to block out dirt and preserve grease. Bearings come greased with air-handling-quality grease. Housing is cast iron; bearing is steel. Temperature range is 0° to +230° F.

Base-mount bearings include two set screws to secure the bearing to the shaft. ***Flange-*** and ***square-flange mount bearings*** lock to the shaft with even-gripping, concentric rings. Simply tighten the three included set screws—a built-in torque indicator tells you when the bearing is perfectly centered.

High-Temperature Cast Iron Mounted Steel Ball Bearings—ABEC-1

Special high-temperature Dow Corning Molykote 44 grease and silicone seals enable these bearings to operate at temperatures from –40° to +356° F. A grease fitting in the housing makes adding lubrication easy. Made to ABEC-1 dimensional tolerance standards, all of these bearings are deep grooved and self-aligning to accommodate 3° of shaft misalignment. Housing is cast iron; bearing components are steel. Furnished with two set screws to secure the bearing to the shaft.

Also Available: Replacement ball bearing inserts. Please ask for 6667K888 and specify bearing part number.

Even-Grip Cast Iron Base-Mounted Steel Ball Bearings—ABEC-1

A ring-style collar makes a nearly perfect 360° grip around your shaft for a strong, mar-free hold. The collar centers the shaft, decreasing vibration and providing smooth rotation. All bearings are made to ABEC-1 dimensional tolerance standards. Housing is cast iron and has a grease fitting for easy lubrication. Bearing insert is steel.

Bearings without Torque Indicator—These bearings are double shielded to block out dirt and accommodate 3° of shaft misalignment. Temperature range is –4° to +212° F. Furnished with a hex-head cap screw to secure the bearing to the shaft.

Bearings with Torque Indicator—All are double shielded to block out dirt and accommodate 2° of shaft misalignment. Temperature range is 0° to +230° F. Furnished with three set screws to secure the bearing to the shaft. Simply tighten the three set screws and a built-in torque indicator tells you when the bearing is perfectly centered.

Without Torque Indicator

Stamped-Steel Mounted Ball Bearings—ABEC-1

Designed with a thin, compact housing, these bearings are perfect for space constrained, light duty applications. All are made to ABEC-1 dimensional tolerance standards and accommodate 3° of shaft misalignment. Bearing inserts are deep grooved and double sealed to block out dirt and preserve lubricants. Temperature range is –4° to +212° F. Furnished with a set-screw locking collar, which holds the bearing securely to the shaft.

Steel—Housing and all bearing components are steel. ***Stainless Steel***—The choice for corrosion resistance. Housing is Type 304 stainless steel. Balls and insert are Type 440C stainless steel.

Miniature Flange-Mounted Stainless Steel Ball Bearings

You'll get food-grade compatibility and excellent corrosion resistance in a very small bearing that can handle a wide range of temperatures. These lightweight bearings have a PEEK housing that is FDA compliant. Bearing components are Type 440C stainless steel. Temperature range is –148° to +480° F.

Open bearings run cool and are easy to lubricate. ***Shielded bearings*** have shields to block out dirt.

Steel Flange-Mounted Ball Bearings

Great for flush mounting, these bearings have an extended inner ring and flanged housing. They are double sealed to block out dirt and preserve lubricants. The housing and all bearing components are steel. Maximum temperature is 250° F. Furnished with two set screws to secure the bearing to the shaft.

Food-Grade Polymer Mounted Ball Bearings

An excellent choice for food-processing applications, these bearings come lubricated with USDA- and FDA-compliant grease. A grease fitting in the housing makes adding lubrication a breeze. All of these bearings have a smooth, corrosion-resistant, solid polymer housing with double-sealed bearing inserts to block out dirt. Furnished with two set screws to secure the bearing to the shaft.

With Corrosion-Resistant Steel Bearing Inserts— These inserts have higher load and speed ratings than the stainless steel inserts and accommodate shaft misalignment up to 2°. They're made of coated steel for corrosion resistance and are precision-machined to meet ABEC-1 dimensional tolerance standards. Temperature range is –22° to +160° F. **Also Available:** Protective end covers. Please ask for 6736K888 and specify shaft diameter.

With Stainless Steel Bearing Inserts— These Type 300 series stainless steel inserts are more corrosion resistant than the steel inserts and will accommodate shaft misalignment up to 3°. They're precision-machined, but they are not made to ABEC-1 tolerances. Temperature range is –25° to +250° F. Furnished with protective end covers.

Maintenance-Free Polyester Mounted Ball Bearings

These lightweight, noncorrosive bearings do not need lubrication and can even be submerged in liquid. Great for use in medical, food, and hygienic applications, they're made of polyester with Type 316 stainless steel balls. All are deep grooved and self-aligning, which means they'll compensate for minor shaft misalignment. They are open bearings, which means they run cool. Temperature range is –40° to +180° F in air. In liquid, the maximum temperature is 120° F (not rated for minimum temperature in liquid). Furnished with a set screw to secure the bearing to the shaft.

These bearings are available with acetal or Type 316 stainless steel raceways. ***Acetal*** is more economical, but ***Type 316 stainless steel*** offers a higher load capacity.

Miniature Aluminum Base-Mounted Stainless Steel Ball Bearings—*ABEC-3*

No need to worry about how you are going to mount a miniature ball bearing—we've taken miniature ball bearings and mounted them in precision bearing housings for you. Sized just right for small spaces, these high-precision bearings have an aluminum housing and Type 440C stainless steel ball bearings for excellent corrosion resistance. All are made to tight ABEC-3 dimensional tolerance standards. They come greased and are double shielded to block out dirt. Temperature range is –22° to +248° F.

Bearings with extended inner ring provide improved performance when used with a shaft collar. The shaft collar mates with the inner ring and doesn't touch moving parts.

For information about roller bearings, see page 1141.

Self-Aligning Steel Flange-Mounted Needle Roller Bearings

In addition to a self-aligning feature that compensates for 5° of shaft misalignment, these bearings handle extremely high speeds for their small size. They are designed for use on hardened and ground shafts.

All bearings have a steel flange with a black-oxide coating for added corrosion resistance. The bearing cage is plastic; all other components are steel. Bearings are open, which means they run cool and are easy to lubricate. Temperature range is –22° to +212° F.

High-Load Even-Grip Cast Iron Base-Mounted Spherical Roller Bearings

Bring on your heaviest loads—these double-row spherical roller bearings give you the highest load capacities of any mounted bearing we offer. They also have a locking ring, which provides a nearly perfect 360° grip around your shaft. You can mount these bearings in minutes and remove them (even if they're dirty and rusted) with the included Allen wrench. To unmount, just loosen two mounting set screws and tighten two dismounting set screws until you hear and feel a pop.

These bearings minimize vibration. They handle both radial (perpendicular to the shaft) and minimal thrust (parallel to the shaft) loads and are self-aligning—accommodating up to 1.5° of shaft misalignment. They're double sealed to block out dirt and preserve lubricants. Housing is cast iron; bearing insert is steel and comes lubricated. A grease fitting in the housing makes adding lubrication easy. Temperature range is –4° to +200° F.

With SYE Mounting Configuration—Dimensionally interchangeable with Dodge Type E designs. ***With SYR Mounting Configuration***—More compact; interchangeable with Rexnord Linkbelt P-B22400 and SKF collar-mounted roller bearings.

Self-Lubricating Stamped Steel Base-Mounted Bronze Bearings

Made of oil-impregnated bronze, these light-duty, low-cost bearings save you time by eliminating the need for routine maintenance. Use them for medium-speed, low-load applications. All include an oil cup (unless noted) for additional lubrication. Housing is stamped steel; bearing insert is SAE 841 bronze (Oilite), which is an alloy of copper, tin, and carbon.

For information about P max, V max, and PV max, see page 1126.

★ Does not include oil cup.

For information about P max, V max, and PV max, see page 1126.

Self-Lubricating Aluminum-Mounted Bronze Bearings

You get to choose which self-lubricating bearing insert you want mounted in a lightweight, corrosion-resistant, sintered aluminum housing. All inserts are self-aligning, accommodating up to 5° of shaft misalignment.

SAE 840 bronze bearing inserts are an alloy of copper, tin, and carbon, impregnated with 25% Mobil DTE Medium oil. The oil acts as a cushion between the shaft and bearing, reducing wear.

PTFE-filled bronze bearing inserts are ultra-slippery and have a much wider temperature range and higher load capacity than the SAE 840 bronze bearing inserts. Use them for high-load, low-speed, and extreme-temperature applications.

Bearing Insert Material	Temp. Range	P max	V max	PV max
SAE 840 Bronze	–20° to +200° F	2,000	1,200	25,000
PTFE-Filled Bronze	–40° to +380° F	8,000	400	50,000

Vibration-Damping Steel Base-Mounted Bronze Bearings

Quiet things down by installing these bearings. All have an insulating layer of flexible neoprene that is sandwiched between a protective high-strength steel shell and a bronze bearing insert, which quiets your equipment by absorbing vibration. To reduce maintenance, the bearing inserts are self-lubricating SAE 841 bronze (Oilite), an alloy of copper, tin, and carbon, impregnated with 20% SAE-30 oil. The oil acts as a cushion between the shaft and bearing, reducing wear and increasing resistance to shock loads (suddenly applied loads). These bearings accommodate up to 3° of shaft misalignment. Housing is steel.

Bearing Material	Temperature Range	P max	V max	PV max
SAE 841 Bronze	0° to 225° F	2,000	1,200	50,000

Nylon Flange-Mounted Sleeve Bearings

Made entirely of nylon, these bearings have a fairly slippery bearing surface, which does not require lubrication when used for light duty applications. In addition to their low cost, all of the bearings are light-weight, rigid, and abrasion resistant. They have a closed back.

Bearing Material	Temperature Range	P max	V max	PV max
Nylon	–25° to +250° F	400	360	3,000

Extreme-Environment Cast Iron Mounted Graphalloy Bearings

From deep cold to punishing heat, these bearings stand up to the widest temperature range of any of our mounted bearings. They accommodate 3° of shaft misalignment and can be used in dry, wet (even submerged), and corrosive environments. Housing is cast iron. Bearing inserts consist of solid graphalloy bushings that have been pressed into cast iron insert housings—so they stay slick their entire service life. Graphalloy is a mixture of graphite, a dry lubricant that reduces wear, and copper, which adds strength and durability.

For information about P max, V max, and PV max, see page 1126.

Bearing Material	Temperature Range	P max	V max	PV max
Graphalloy	–400° to +750° F	750	75	12,000

Cast Iron Base-Mounted Babbitt-Lined Bearings

Solid Bearing

Split Bearing

Choose these reliable classics for their high-strength and low-friction qualities. All are lined with corrosion-resistant babbitt (a mixture of lead, antimony, and tin). The housing is cast iron and has a hole with NPT female threads (H) for lubrication. For information about P max, V max, and PV max, see page 1126. ***Split bearings*** have a removable section for easy maintenance.

Metric Extreme Misalignment Base-Mounted Nylon Bearings

To accommodate extreme cases of shaft misalignment, these bearings have a self-lubricating bearing insert that swivels. The bearing insert is reinforced nylon and the housing is fiber-reinforced plastic. Bearings are 80% lighter than steel and resistant to corrosion, wear, shock, and vibration. Temperature range is –40° to +176° F.

Food-Grade Base-Mounted Plastic Bearings

With bearing surfaces of USDA- and FDA-compliant UHMW (ultra high molecular weight) polyethylene or FDA-compliant PEEK (polyetheretherketone), these bearings are not only suitable for direct contact with food, but also able to withstand wet, corrosive environments. For information about P max, V max, and PV max, see page 1126.

UHMW Base-Mounted Bearings— All are made of a single UHMW polyethylene block. They have good vibration-damping qualities. ***Stainless Steel Base-Mounted Bearings with UHMW Insert—*** The housing is made of Type 304 stainless steel and the bearing insert is UHMW polyethylene. All bearings accommodate shaft misalignment up to 3°. ***PEEK Flange-Mounted Bearings—*** Made entirely of PEEK, these bearings offer good chemical compatibility with high load capacity. They have a closed back.

Bearing Material	Temperature Range	P max	V max	PV max
UHMW	–200° to +180°F	1,000	100	2,000
PEEK	–148° to +480°F	21,750	295	37,000

Aluminum Base- and Flange-Mount Bearing Housings

Mate one of these housings with your own bearing to create a custom mounted bearing. To begin, choose a housing ID that matches your bearing OD and simply press the bearing into place. If you don't see an exact match, you can machine the housing ID larger to fit. All housings are made of precision-sintered aluminum.

Ball Bearing Shim Rings

Also called tolerance rings, these Type 301 stainless steel rings are for use in your stamped, molded, or worn housings to form a tight hold on your bearings. They operate like a spring, compressing and expanding, creating tension between the bearing and the housing to hold your bearing in place. Rings reduce vibration and compensate for some thermal expansion between the housing and the bearing. They eliminate the need for keys, pins, and adhesives. Rings are 0.008" to 0.020" (0.2032 to 0.508 mm) thick with corrugations from 0.0295" to 0.0492" (0.7493 to 1.2497 mm) high and allow for 0.5° of misalignment.

About Bearing Heaters

Heating your bearings makes them easier to install and reduces damage to your shafts during installation. The heaters work by expanding your bearing's inner race, so you get a snug fit without forcing a tight-fitting bearing onto a shaft. Heaters can also be used on gears, sprockets, pulleys, and bushings. ***Induction bearing heaters*** will not magnetize heated items.

Cone-Mount Bearing Heaters

Automatic (Shown w/Bearing)

For fast, even heat transfer, these heaters boast a cone-shape design. The cone is aluminum and the base is chrome-plated steel, unless noted.

Heaters operate on 120 VAC, 60 Hz and have a heating time of 2 to 30 minutes. Furnished with an on/off switch and an 8-ft. power cord with three-prong plug.

Manual heaters include a temperature-indicating crayon. The crayon mark melts when bearing reaches 250° F with ±25° F accuracy.

Automatic heaters include a thermostat that automatically brings the temperature up to 250° F with ±25° F accuracy.

Bearing ID Range	Watts	Ht. × Wd.		Each
Manual Heaters				
3/8″- 5 3/4″	725	10″ × 10″	6519K11	$323.75

Automatic Heaters				
3/4″- 8″	725	10″ × 10″	6519K19	546.52
5 1/2″-18″	1450	14″ × 21″	6519K21●	1,087.25

● Base is aluminum.

Ultra-Portable Miniature Induction Bearing Heater

Shaped like a large flashlight, this 2 1/2″ OD × 15″ Lg. induction-style heater easily fits in your hand to go where you go. It's perfect for use on bearings that are up to 2″ ID and 3″ OD. The heater housing is made of plastic.

Heater operates on 120 VAC, 50/60 Hz and includes three heating coils to handle a variety of heating jobs. It also has a thermal switch for thermal overload protection. Furnished with a 5 1/2-ft. power cord with three-prong plug and a plastic carrying case.

This heater can also be used on stubborn and rusted nuts. It is not rated for temperature. Demagnetization is not necessary after heating.

6083K11 ..... **Each** $516.44

Portable Digital Induction Bearing Heater

Take this completely portable heater anywhere it's needed. It has a heat clamp with a 2″ × 2″ opening to hold bearings that are 2″ wide and smaller with a 0.8″ to 4″ ID. The clamp is iron encased in phenolic plastic.

Heater operates on 110 or 240 VAC, 50/60 Hz and has a temperature range of 32° to 392° F with ±6° F accuracy. It has a time control that lets you vary the heating time from 0 to 60 minutes to prevent overheating. Furnished with a 6.6-ft. power cord (plug not included, see pages 784-789), temperature probe, heat-resistant gloves, and a padded carrying case with shoulder strap. Demagnetization is not necessary after heating.

5208A6 ..... **Each** $2,343.73

Hot-Plate Bearing Heater

An aluminum heating plate uniformly heats the top and bottom of your bearings. It adjusts to fit bearings up to 2″ thick and can heat more than one bearing at a time. The plate is housed in a 5″ Ht. × 16″ Wd. × 10″ Dp. metal case that minimizes heat loss and prevents dirt from entering your bearings.

Heater includes a thermostat that adjusts from 120° to 390° F with ±18° F accuracy. The thermostat has an automatic shut-off in case of thermostat failure. Heater operates on 115 VAC, 50/60 Hz and is rated to 1000 watts. Furnished with a 6.6-ft. power cord (plug not included, see pages 784-789). Demagnetization is not necessary after heating.

6503K45 ..... **Each** $1,199.49

Fast-Heating Digital Induction Bearing Heater

Heat a 60-lb. bearing in just 20 minutes. This fast-heating induction style heater comes with three sizes of steel crossbars (0.5″, 1.1″, and 1.7″ sq.) that hold bearings with a 0.8″ to 11.8″ ID. Maximum bearing weight is 88 lbs.

Heater operates on 110 VAC, 50/60 Hz and has a temperature range of 32° to 482° F with ±3.6° F accuracy. It automatically demagnetizes bearings after heating and includes a temperature probe, 0- to 60-minute time control, circuit breaker with over-current protection, and automatic over-heating protection.

Heater housing is steel and glass-filled polyamide. It measures 8.2″ Ht. × 17.7″ Wd. × 7.6″ Dp. Furnished with a 4.6-ft. power cord with three-prong plug.

7167K11 ..... **Each** $2,787.92

Digital Induction Bearing Heater

To ensure precise heating time and temperature control, this heater includes a microprocessor and keypad control. The digital display shows actual temperature, set temperature, and the time remaining.

This induction-style heater has aluminum crossbars that hold bearings up to 6 1/8″ wide with a 0.79″ and larger ID. Maximum bearing weight is 25 lbs.

Heater operates on 110-120 VAC, 50/60 Hz and has a maximum temperature of 465° F with ±5° F accuracy. It automatically demagnetizes bearings after heating and includes a temperature probe, an automatic and timed shutoff, a temperature hold feature, and thermal overload protection. Heater housing is polyurethane and aluminum. It measures 12 13/16″ Ht. × 12 5/8″ Wd. × 13″ Dp. Furnished with a 9-ft. power cord with three-prong plug.

6666K73 ..... **Each** $4,196.88

Crossbar Induction Bearing Heaters

These induction-style heaters have laminated steel crossbars to handle a wide range of bearing ODs and widths. They heat most bearings in 2 to 20 minutes.

The heaters include two sizes of crossbars. The crossbar size determines the bearing ID that can be accommodated (see listing for sizes). For the fastest heating, use the largest crossbar that fits through your bearing. The maximum heating temperature is 400° F. Temperature-indicating crayons are recommended (not included; see 3261K on page 606).

Heaters have an on/off switch, a grounded outer case, and 6-ft. long three-wire power cord. Model 6174K63 has a three-prong plug; models 6174K64 and K66 do not have a plug and must be hardwired. Heaters can be used for demagnetizing.

Max. Bearing OD	Wd.	Crossbar Sizes (sq.)	Voltage @ 60 Hz	O'all Size, Ht. × Wd.		Each
11″	4 3/8″	3/4″, 2″	110 VAC	9 3/4″ × 11 1/4″	6174K63	$1,310.71
22″	8″	1 1/4″, 3″	220 VAC	17 1/4″ × 17 1/4″	6174K64	2,606.08
22″	12 1/4″	1 1/4″, 3″	440 VAC	17 1/4″ × 21 3/4″	6174K66	2,868.54

Accessories

Heat Thermometer— More accurate than temperature-indicating crayons, this thermometer measures the temperature of heated bearings and gears to ±0.5° F. This digital reader includes a probe, flexible cord, and batteries. Temperature range is –58° to +1999° F.

6174K82 ..... **Each** $270.91

Riser Blocks— Use these blocks to lift bearing heater crossbars to accommodate larger diameter bearings for heaters listed above.

For Heater	Maximum Bearing OD	Block Size, Lg. × Wd. × Ht.		Per Pair
6174K63	14″	2 5/8″ × 2 5/8″ × 2 3/8″	6174K71	$254.01
6174K64 and 6174K66	32″	3 5/8″ × 3 5/8″ × 5″	6174K72	326.00

About Shaft Collars

Shaft collars are useful in machine applications for holding components on shafts. They also serve as mechanical stops and stroke limiters. There are several shaft collar styles to choose from.

Set Screw Style— Just slide these collars onto an unhardened shaft and tighten the set screw to hold the collar in place. Collars are easy to adjust, but their set screws can cause marring. Not effective on hardened shafts.

Clamp-On Styles— Allow greater clamping force than set screw shaft collars, plus they won't mar the shaft. *One-piece clamp-on shaft collars* slide onto the shaft and secure with one screw. They clamp evenly around the shaft, providing excellent holding power. *Two-piece clamp-on shaft collars* are similar to one-piece collars, except they come apart in two halves for easier installation and maintenance. *Two-piece clamp-on shaft collars with keyway* allow easy installation on keyed shafts and prevent collars from slipping on shafts.

Threaded, Square, and Hex Bore Styles— *Threaded bore shaft collars* install on threaded shafts to provide excellent contact with shaft threads for secure locking as well as easy adjustments. Ideal for high thrust loads. As their name implies, *square and hex bore shaft collars* fit either square- or hex-shaped shafts and offer maximum holding power. *Hex bore collars* are particularly good for direct drive applications.

Set Screw

One-Piece Clamp-On

Two-Piece Clamp-On

Square Bore

Set Screw Shaft Collars

Just slide the collar on a shaft and tighten the hex-socket cup-point set screw to secure. Set screw is alloy steel, except for the *Type 303 stainless steel* shaft collars, which have 18-8 stainless steel set screws, and *Type 316 stainless steel* shaft collars, which have Type 316 stainless steel set screws.

Black-Oxide Steel— Made of carbon steel. Black-oxide finish offers some corrosion resistance. ***Zinc-Plated Steel—*** Same clamping force as black-oxide steel but with better corrosion resistance. ***Stainless Steel—*** Choose *Type 303 stainless steel* for excellent corrosion resistance. For superior corrosion and chemical resistance, choose *Type 316 stainless steel*. ***Aluminum—*** Lightweight with good corrosion resistance.

Brass, Nylon, and Sintered Steel Set Screw Shaft Collars

Slide the collar on the shaft and tighten the socket-head cup-point set screw to secure.

Brass— Softer than steel, these Alloy 360 brass collars are spark resistant. Set screw is 18-8 stainless steel. ***Nylon—*** Collars are nylon 101 and are excellent for food and pharmaceutical processing. Set screw is Type 304 stainless steel. Color is white. Max. temp. is 210°F. Collars are USDA, FDA, and 3-A compliant. ***Sintered Steel—*** Made from powdered metal so they are substantially lighter than steel collars. They have a rust-inhibiting coating. Set screw is steel.

Metric Set Screw Shaft Collars

Slide this metric collar on the shaft and tighten the hex-head cup-point set screw.

Black-Oxide Steel— Made of carbon steel. Black-oxide finish offers some corrosion resistance. Set screw is steel. ***Type 303 Stainless Steel—*** Have excellent corrosion resistance. Set screw is 18-8 stainless steel.

Easy-Install Set Screw Shaft Collars

A two-piece interlocking design and easy access with a single set screw lets you install these collars without disassembling other equipment. Each has one hex-head steel set screw (unless noted) and a rugged cast iron construction with zinc plating for corrosion resistance.

■ Two set screws.

Metric One-Piece Clamp-On Shaft Collars

One-piece metric clamp-style collars grip evenly around the entire shaft. They won't mar the shaft and they allow greater clamping force than set screw collars. Tighten the alloy steel socket-head cap screw to secure.

Black-Oxide Steel— Made of grade 1215 steel or equivalent. Black-oxide finish offers some corrosion resistance. ***Aluminum—*** Lightweight with good corrosion resistance.

For information about shaft collars, see page 1165.

One-Piece Clamp-On Shaft Collars

Collars grip evenly around the entire shaft without marring, allowing greater clamping force than set screw collars. Tighten the socket-head cap screw to secure. Cap screws are alloy steel, except for the stainless steel, chrome-plated steel, and plastic shaft collars, which have 18-8 stainless cap screws.

Black-Oxide Steel—Made of grade 1215 steel, unless noted. Black-oxide finish offers some corrosion resistance. ***Zinc-Plated Steel***—Same clamping force as black-oxide steel but with better corrosion resistance. ***Stainless Steel***—Choose *Type 303 stainless steel* for excellent corrosion resistance. For superior corrosion and chemical resistance, choose *Type 316 stainless steel*. ***Aluminum***—Lightweight with good corrosion resistance. ***Chrome-Plated Steel***—Have the strength and corrosion resistance of zinc-plated steel with a bright finish. ***Nylon 6/6*** and ***Delrin® Acetal Resin***—Offer good chemical resistance and are suitable for washdown applications.

Two-Piece Clamp-On Shaft Collars

These two-piece clamp-on collars come apart for easy installation and go anywhere on a shaft, even between components. Each has two socket-head cap screws that provide a tight, uniform grip around the entire shaft without marring. ***Black-Oxide Steel***—Made of grade 1215 steel or equivalent. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Zinc-Plated Steel***—Same clamping force as black-oxide steel but with better corrosion resistance. Cap screws are zinc-plated alloy steel. ***Stainless Steel***—Choose *Type 303 stainless steel* for excellent corrosion resistance. For superior chemical and corrosion resistance, choose *Type 316 stainless steel*. All cap screws are 18-8 stainless steel. ***Aluminum***—Lightweight with good corrosion resistance. Cap screws are alloy steel. ***Chrome-Plated Steel***—Have the strength and corrosion resistance of zinc-plated steel with a bright finish. Cap screws are 18-8 stainless steel. ***Nylon***—Offer good chemical resistance and are excellent for food processing applications. Set screws are Type 304 stainless steel. Maximum temperature is 210° F. USDA, FDA, and 3-A compliant.

For information about shaft collars, see pg. 1165. For information about ANSI keyway dimensions, see pg. 1174.

Metric Two-Piece Clamp-On Shaft Collars

A two-piece metric design makes collars easy to install, especially when it's difficult to access the end of a shaft. They install anywhere on a shaft, even between components. Each has two socket-head cap screws that hold the clamp together and provide a tight, uniform grip around the entire shaft without marring.

Black-Oxide Steel—Made of grade 1215 steel. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel***—Have excellent corrosion resistance. Cap screws are alloy steel. ***Aluminum***—Lightweight with good corrosion resistance. Cap screws are alloy steel.

Mounting Flange One-Piece Clamp-On Shaft Collars

Eliminate the need to weld your components to a shaft collar. Mounting holes in these collars make it easy to fasten components such as gears, pulleys, and sprockets. They are one-piece clamp-on style and won't mar shafts. Made of carbon steel with a black-oxide finish, which offers some corrosion resistance.

Face mount have two tapped holes in the collar face with one clamping socket-head cap screw, which is alloy steel.

Flanged collars with standard ANSI keyway have three tapped counterbored holes and three through holes for additional mounting options. The two socket-head cap screws are alloy steel. For keyed shafts, see pages 1082-1084. ***Adapter rings*** have three through holes that mate to the flanged mounting holes. Made of machinable and weldable grade 1018 steel.

Hexagonal-Bore Clamp-On Shaft Collars

Just what you need for hexagon-shaped shafts. These nonmarring collars have high holding power, a round outside diameter, and recessed screw heads. Simply tighten the socket-head cap screw(s) to secure. These collars can also be modified to act as a mount for other components.

One-piece collars have one cap screw. ***Two-piece collars*** are a good choice when you don't have easy access to the end of the shaft. They have two cap screws.

Black-Oxide Steel—Collars are grade 12L14 and have a black-oxide finish, which offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel***—Collars are Type 303 stainless steel for excellent corrosion resistance. Cap screws are 18-8 stainless steel.

Hinged One-Piece Clamp-On Shaft Collars

Closed

A heat-treated, triple-link hinge connects the collar halves. Just swing the collar open, place it on the shaft, close the collar, and tighten the captive socket-head clamping screw to secure. The "captive" screw won't fall out, so it's great for cramped areas where your hands can't hold it.

Black-Oxide Steel— Made of carbon steel. A black-oxide finish offers some corrosion resistance. Clamping screw is alloy steel. ***Type 303 Stainless Steel—*** Have excellent corrosion resistance. Clamping screw is 18-8 stainless steel.

Flush-Face One-Piece Clamp-On Shaft Collars

Machine Face

Precision Ground

These collars have two sides—one side locks down like a normal one-piece shaft collar; the other side has a flush face with no groove to allow you to match your special setup.

Made of grade 1117 steel with a black-oxide finish, which offers some corrosion resistance. All have two alloy steel socket-head cap screws.

Machinable face allow you to add slots, holes, and grooves to the flush side. ***Precision ground*** have a flush side that's flat (to 0.0005"), which lets you mount the collars on a shaft next to precision bearings, sprockets, and gears.

Inch-to-Metric Two-Piece Clamp-On Shaft Collars

Stuck with an inch-sized shaft and metric equipment? Inch bore sizes with metric OD, width, and screw sizes on these collars solve your problem. A two-piece design makes them easy to install anywhere on a shaft, even between components. Each has two socket-head cap screws that hold the clamp together and provide a tight, uniform grip around the entire shaft without marring.

Black-Oxide Steel— Made of lead-free grade 1215 steel. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel—*** Have excellent corrosion resistance. Cap screws are stainless steel. ***Black Anodized Aluminum—*** Lightweight, good corrosion resistance. Cap screws are stainless steel. ***Titanium—*** Handle high temperatures. Have excellent strength and corrosion resistance. Cap screws are titanium. ***Acetal—*** Offer good chemical resistance and are suitable for wash-down applications. Cap screws are stainless steel. Color is white. Maximum temperature is 150° F.

For information about shaft collars, see pg. 1165. For information about ANSI keyway dimensions, see pg. 1174.

Two-Piece Clamp-On Shaft Collars with Keyway

An ANSI keyway lets you use these collars with keyed shafts. Their two-piece design makes them easy to install. All have two socket-head cap screws. For keyed shafts, see pages 1082-1084.

Black-Oxide Steel—Made of grade 1215 steel. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel***—Have excellent corrosion resistance. Cap screws are Type 303 stainless steel. ***Aluminum***—Lightweight with good corrosion resistance. Cap screws are 18-8 stainless steel.

Two-Piece Clamp-On Shaft Collars with Wrench Flats

Need to rotate your drive shaft, but don't want to mar or gouge it? Just fasten one of these collars onto your shaft, position a standard wrench (not included) on the wrench flats on the collar, and then rotate the entire shaft/collar assembly.

These two-piece collars mount anywhere on your shaft—great when you don't have easy access to the end of the shaft. All are made of steel and have a black-oxide finish, which offers some corrosion resistance. They also have two alloy-steel socket-head cap screws, which you tighten to secure.

Extra-Grip Clamp-On Shaft Collars

The larger OD and larger socket-head cap screws result in a stronger grip on your shaft. Collars are nonmarring and easy to adjust. Made of grade 12L14 steel with a black-oxide finish, which offers some corrosion resistance. Cap screws are alloy steel.

One piece have one cap screw. ***Two piece*** are a good choice when you don't have easy access to the end of the shaft. They have two cap screws.

Machinable-Bore Clamp-On Shaft Collars

Machine the bore of these collars to precisely fit your odd-sized shaft. Made of grade 1215 steel or equivalent with a black-oxide finish, which offers some corrosion resistance. Tighten the alloy steel socket-head cap screws to secure.

One piece have one cap screw. ***Two piece*** are a good choice when you don't have easy access to the shaft's end. They have two cap screws.

For information about shaft collars, see page 1165.

Threaded Clamp-On Shaft Collars

One Piece

Hinged One Piece

Two Piece

Easy-to-adjust threaded bore design provides excellent contact with shaft threads. Collars have right-hand threads and socket-head cap screws.

One-piece threaded collars have one cap screw for secure locking. ***Hinged one-piece threaded collars*** offer two-piece flexibility in a one-piece collar design.

Two-piece threaded collars fit anywhere on the shaft without removing other equipment. Two cap screws hold the collar together and provide a uniform grip around the entire shaft diameter.

Black-Oxide Steel— Made of grade 12L14 steel or equivalent. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel—*** Offer excellent corrosion resistance. Cap screws are 18-8 stainless steel.

Weldable Shaft Collars

One Piece

Two Piece

Because these collars are grade 1018 steel, you can permanently weld them to other components.

One-piece slide onto the shaft and secure with one screw, providing excellent holding power.

Two-piece are similar to one-piece collars, except they come apart in two halves for easier maintenance and replacement.

Bore	OD	Wd.	Screw Size	One Piece	Each	Two Piece	Each

End-Stop Clamp-On Shaft Collars

One Piece

Two Piece

The clamp design creates a secure, even grip. Make sure the end-stop bore you choose has the same shaft OD as your precision shaft and rail assembly. All collars have one socket-head cap screw; tighten to secure. ***Two-piece collars*** mount anywhere on your shaft—great when you don't have easy access to the end of the shaft.

Black-Oxide Steel— Collars have a black-oxide finish, which offers some corrosion resistance. Cap screw is alloy steel. ***Type 303 Stainless Steel—*** Collars and cap screw are Type 303 stainless steel for excellent corrosion resistance.

Ultra-Grip Shaft Collars

Bring on the big jobs. Collars handle almost three times the thrust load carrying capacity of other heavy duty collars and have superior holding power. Two halves tighten around an embedded ID sleeve, ensuring a firm grip around the entire shaft. Use the included steel socket-head cap screws to tighten. Made of carbon steel with a black-oxide finish, which offers some corrosion resistance.

2 1/2"	5"	1 3/4"	M8	9665T8	115.27

For information about shaft collars, see page 1165.

Extra-Wide Clamp-On Shaft Collars

A larger width than other shaft collars gives these clamp-on collars greater holding power and a higher thrust load carrying capacity. They have twice the number of socket-head cap screws for a secure hold.

One-piece collars have two socket-head cap screws. ***Two-piece collars*** are a good choice when you don't have easy access to the end of the shaft. They have four cap screws.

Black-Oxide Steel— Made of grade 1215 steel. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel—*** Have excellent corrosion resistance. Cap screws are stainless steel. ***Aluminum—*** Lightweight with good corrosion resistance. Cap screws are stainless steel.

Adjustable-Width Clamp-On Shaft Collars

Precisely adjust the width of these collars to set the stroke length of a linear sliding guide rod or shaft. Just slide the collar in place, tighten the two socket-head cap screws on one side, rotate the other side until it's in position, and tighten the screws on that side.

Adjustable-width collars have one screw. One knurled side provides easy lateral adjustments of 13/64" to 7/16".

Ultra-precision adjustable-width collars have two screws. Two knurled sides provide micrometer-like movement for lateral adjustments of 3/8" to 3/4". 40-pitch threads provide 0.025" of travel per turn.

Black-Oxide Steel— Made of steel. Black-oxide finish offers some corrosion resistance. Cap screws are alloy steel. ***Type 303 Stainless Steel—*** Offer excellent corrosion resistance. Cap screws are 18-8 stainless steel.

Bearing Locknut Shaft Collars

In addition to ultra-fine threads, which provide very close engagement on your shaft, these collars have a flexible lining that "hugs" your shaft for superior holding power. They help eliminate the looseness commonly associated with locknuts that use keyways and lockwashers, which are not required with these collars. They also allow precise positioning, increased thread contact, and better squareness of the retaining ring to the bearing face. All of these collars work with SAE, ABEC, and ANSI/ABMA standard products.

Steel— Collars are made of grade 1215 steel. ***Type 303 Stainless Steel—*** Collars are Type 303 stainless steel for excellent corrosion resistance.

Quick-Release Handles for One-Piece Shaft Collars

If you frequently move collars along shafts, you'll no longer have to search for a wrench to adjust them. Use one of these knurled handles to replace your one-piece collar's socket-head cap screw (just match the screw size). The handle keeps the collar secure on the shaft, then lets you loosen and tighten the collar for quick adjustments.

Ultra-grip handles give you the option of using a wrench on the wrench flat or a cheater bar in the through hole for additional tightening force.

Black-Oxide Steel— Made of grade 12L14 steel. Black-oxide finish offers some corrosion resistance. ***Type 303 Stainless Steel—*** Offer good corrosion resistance.

About Couplings and Keyways

Couplings connect two shafts and transfer motion from one shaft to another. They attach via cap screws, set screws, a combination of keyways and set screws, or bushings. There are two main types of couplings: rigid, which allow no shaft misalignment and flexible, which allow some misalignment. Use the charts below as a guide to select the right coupling for your application. For actual performance ratings, please see the individual coupling presentations.

For applications with shaft misalignment, these are the couplings to choose:

 Parallel Shaft Misalignment	 Angular Shaft Misalignment	 Axial Shaft Misalignment
Couplings Best Suited for Starting, Stopping, and Reversing Motions		
Slotted Disc, Double Loop, Pinhole Disc	Beam, Double Loop	Beam, Double Loop, Pinhole Disc
Couplings Best Suited for Transmitting Torque and Power in Alternating Motions		
Tire, Gear and Sleeve	Tire, Gear and Sleeve	Tire, Multi-Flex

For applications that require high torque capacity, speed, or dampening capacity, these are the couplings to choose:

Torque Capacity	Speed (rpm)	Dampening Capacity
Couplings Best Suited for Starting, Stopping, and Reversing Motions		
Rigid	Bellows, Spider, Servomotor Double Disc	Double Loop, Spider
Couplings Best Suited for Transmitting Torque and Power in Primarily One Direction		
Roller Chain, Gear and Sleeve	Shear, Multi-Flex, Gear and Sleeve	Shear, Tire, Multi-Flex

Torque Capacity— Couplings are rated by the maximum torque they can carry, and sometimes by a limiting or maximum rpm. Maximum torque can be used to determine horsepower (or vice versa) with the formula:

$$hp = \frac{\text{Torque (in.-lbs.)} \times \text{rpm}}{63{,}000}$$

ANSI Keyways— Couplings with keyways give you a more secure hold and are especially good for alternating-motion applications. Keyways follow standard ANSI dimensions listed.

Set-Screw Shaft Couplings

Without Keyway

For a positive lock on your shaft, simply slide on one of these couplings and tighten the two set screws. ***Couplings with ANSI keyway*** give you a more secure hold and are especially good for alternating-motion applications. They have standard ANSI keyway dimensions.

Aluminum— Couplings are lightweight, corrosion-resistant, Type 6061-T651 or equivalent aluminum. Set screws are alloy steel. ***Steel—*** Couplings are Grade 1215 or equivalent steel. Set screws are alloy steel. ***Type 303 Stainless Steel—*** Couplings and set screws are Type 303 stainless steel for excellent corrosion resistance.

Machinable-Bore One-Piece Clamp-On Shaft Couplings

One end (Bore A) has a finished bore; the other (Bore B) can be machined to any size up to the size of Bore A to meet your exact needs. All of these clamp-on couplings offer superior holding power over set-screw couplings, plus they won't damage your shaft. Just slide them onto your shaft and tighten the four socket-head cap screws to secure. Couplings are Grade 12L14 steel. Cap screws are alloy steel.

Note: Not rated for max. rpm.

One-Piece Mounting Flange Clamp-On Shaft Couplings

With a flange, which has three through holes and three tapped holes, you can connect sprockets, pulleys, and other drive components to these couplings. All couplings are steel. They clamp on for superior holding power without damaging your shaft. Tighten the four socket-head cap screws to secure. A keyway with standard ANSI keyway dimensions provides a more secure hold making these couplings especially good for alternating-motion applications.

Bore	O'all Lg.	OD	Screw Size	Mounting Flange OD	Mounting Flange Thick.	Mounting Flange Through Holes	Mounting Flange Tapped Holes	Max. rpm	Max. Torque, in.-lbs.		Each

Light Duty Two-Piece Clamp-On Shaft Couplings

Light in weight and offering good corrosion resistance, these couplings are made of Alloy 6061-T6 aluminum. All have a two-piece design, which means you can mount them anywhere on your shaft without disassembling your machinery. They clamp on for superior holding power without damaging your shaft. Tighten the four socket-head cap screws to secure. **To Order:** Please specify Bore (A) × Bore (B) combination.

Available Bore (A) × Bore (B) Size Combinations	Max. Torque, in.-lbs.	Lg.	OD	Screw Size	Max. rpm		Each
1/4″ × 1/4″, 1/4″ × 3/8″, 3/8″ × 3/8″	100	2 1/2″	1 7/8″	10-32	3,450

1″ × 1″, 1 1/8″ × 1 1/8″	500	2 1/2″	1 7/8″	10-32	3,450	6115K1	$18.34

For information about couplings and ANSI keyway dimensions, see page 1174.

Two-Piece Clamp-On Shaft Couplings

With Keyway

Made to come apart in two halves, you can install and remove these couplings anywhere on your shaft without disassembling your machinery. They clamp on for superior holding power without damaging your shaft. Tighten the eight socket-head cap screws to secure.

Couplings with ANSI keyway give you a more secure hold and are especially good for alternating-motion applications. They have standard ANSI keyway dimensions.

Steel— Couplings are Grade 1215 steel. Cap screws are alloy steel. ***Type 303 Stainless Steel—*** Couplings are Type 303 stainless steel for excellent corrosion resistance. Cap screws are 18-8 stainless steel.

★ Bore (B) does not have a keyway.

Extra-Large Two-Piece Clamp-On Shaft Couplings

These rugged cast-iron couplings handle high torque and are longer than our other rigid couplings to maintain alignment on long shaft runs. Able to come apart in two halves, you can install and remove them anywhere on your shaft without disassembling your machinery. They clamp on for superior holding power without damaging your shaft. Tighten the six bolts (unless noted) to secure. A keyway with standard ANSI keyway dimensions (unless noted) provides a more secure hold making these coupling especially good for alternating-motion applications. **To Order:** Where applicable, please specify bore size from those listed (bore is same size on each end).

Available Bore Sizes	Lg.	OD	Bolt Size	Max. rpm	Max. Torque, in.-lbs.		Each

● Has four bolts. ◆ Keyway is 3/8" Wd. × 3/16" Dp.

Clamp-On Shaft Adapters

Convert your shaft from one size to another. One side of each adapter has a two-piece coupling connection that clamps on to the end of your shaft; the other provides the converted shaft size as well as extends your shaft. Tighten the four cap screws to secure. All adapters are Grade 12L14 steel and have a black-oxide finish, which offers some corrosion resistance. Cap screws are alloy steel.

Step-up adapters make your shaft larger. ***Step-down adapters*** make your shaft smaller.

High-Torque Keyless Clamp-On Shaft Couplings

One Piece

With more cap screws and up to two and a half times the torsional load capacity of most other rigid couplings, these may make keyways unnecessary. They clamp on for superior holding power without damaging your shaft. Tighten the socket-head cap screws (6 on one piece; 12 on two piece) to secure.

Couplings are steel with a black-oxide finish, which offers some corrosion resistance. Cap screws are alloy steel. ***One-piece couplings*** slide on to your shaft. ***Two-piece couplings*** come apart in two halves so you can install and remove them anywhere on your shaft without disassembling your machinery.

For information about couplings and ANSI keyway dimensions, see page 1174.

High-Torque Clamp-On Shaft Couplings

Great for maintaining precise shaft alignment, these couplings have a higher working torque than most other rigid couplings. They clamp on for superior holding power without damaging your shaft. Tighten the socket-head cap screws to secure. A keyway with standard ANSI keyway dimensions provides a more secure hold making these couplings especially good for alternating-motion applications.

All couplings and cap screws are steel. ***One-piece couplings*** slide on to your shaft. They have four cap screws. ***Two-piece couplings*** come apart in two halves so you can install and remove them anywhere on your shaft without disassembling your machinery. They have six cap screws.

One Piece

Bore (A)	Bore (B)	Lg.	OD	Screw Size	Max. rpm	Working Torque, in.-lbs.	*One Piece*	Each	*Two Piece*	Each

Flexible Spider Shaft Couplings

Consisting of a spider-shaped "cushion" that fits between two coupling hubs, these couplings reduce shock and compensate for minor misalignment. When choosing hubs and spiders, they must be the same size. For example, two size A hubs are designed to work with one size A spider.

Coupling Hubs— These hubs fasten to your shaft with an included set screw. Hubs with 1/2″ and larger bore sizes have ANSI keyways (unless noted) with standard ANSI keyway dimensions for a more secure hold and are especially good for alternating-motion applications. Choose *Type 304 stainless steel hubs* for excellent corrosion resistance. **To Order:** For iron inch bore hubs, please specify bore size in 1/16″ increments from those available below. For all other hubs, please specify bore size from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Solid Spiders— To create a complete solid-spider coupling, you must order two coupling hubs and one spider. *Buna-N models* provide good vibration dampening and chemical resistance. Angular misalignment is 1°. Parallel misalignment is 0.015″. Temp. range is –40° to +212° F. *Hytrel models* provide fair vibration dampening and excellent chemical resistance. Angular misalignment is 1/2°. Parallel misalignment is 0.015″. Temp. range is –60° to +250° F. *Urethane models* provide fair vibration dampening, good chemical resistance, and good torque capacity. Angular misalignment is 1°. Parallel misalignment is 0.015″. Temp. range is –30° to +160° F.

Split Spiders— You can easily remove and replace these spiders without tools. To create a complete split-spider coupling, you must order two hubs, one split spider, and one retaining ring to twist-lock the spider in place. All split spiders are made of urethane for fair vibration dampening, good chemical resistance, and good torque capacity. Angular misalignment is 2°. Parallel misalignment is 0.03″ (0.047″ for 2393K37). Temp. range is –30° to +200° F.

Retaining Rings— All are Type 347 stainless steel for excellent corrosion resistance.

For information about couplings and ANSI keyway dimensions, see page 1174.

SAE-Splined Flexible Spider Shaft Couplings

Shown Assembled

Just like the Flexible Spider Shaft Couplings on the previous page, but with a splined hub, which allows excellent engagement for hydraulic motor and pump applications. To create a complete spider coupling, you must order two coupling hubs (sold below) and one spider (see 6408K and 2410K spiders sold on the previous page). When choosing hubs and spiders, they must be the same size. For example, two size E hubs are designed to work with one size E spider.

Coupling Hubs— Made of cast iron, these hubs clamp on for superior holding power without damaging your shaft. Tighten the socket-head cap screws to secure. **To Order:** Please specify SAE spline size from those available below.

Spiders— See compatible 6408K and 2410K spiders on the previous page.

Spline Dimensions					
SAE Size	Dia. (X)	Dia. (Y)	No. of Teeth	Pitch	Pressure Angle

Miniature Flexible Spider Shaft Couplings

Shown Assembled

Here's our miniature version of the Flexible Spider Shaft Couplings on the previous page. All allow zero backlash (no play) and are great for precision motion-control applications. For a complete coupling, you need to order two hubs and one spider from the same line in the listing below (for example, two 2401K12 hubs are designed to work with one 2401K81 or one 2401K82 spider).

Coupling Hubs— Made of lightweight, corrosion-resistant aluminum, these hubs clamp on for superior holding power without damaging your shaft. Tighten the socket-head cap screws to secure. **To Order:** Please specify bore size from those available below.

Spiders— *Urethane models* provide fair vibration dampening, good chemical resistance, and good torque capacity. Angular misalignment is 1°. Parallel misalignment is 0.004″-0.006″. Temp. range is –40° to +195° F. *Hytrel models* provide fair vibration dampening and excellent chemical resistance. Angular misalignment is 0.8°. Parallel misalignment is 0.001″-0.002″. Temp. range is –55° to +245° F.

Zero-Backlash Flexible Spider Shaft Couplings

Shown Assembled

Similar to the Flexible Spider Shaft Couplings on the previous page, except these allow zero backlash (no play). To create a complete spider coupling, you must order two coupling hubs and one spider. When choosing hubs and spiders, they must be the same size. For example, two size 1 hubs are designed to work with one size 1 spider.

Coupling Hubs— All couplings are lightweight and corrosion resistant. They clamp on (unless noted) for superior holding power without damaging your shaft. Tighten the socket-head cap screws to secure. **To Order:** Please specify bore size from those available below.

Spiders— All are made of urethane for fair vibration dampening, good chemical resistance, and good torque capacity. Parallel misalignment is 0.002″-0.006″ for Styles 1-6; 0.003″-0.008″ for Styles 7-10. Temp. range is –10° to +180° F.

For information about couplings and ANSI keyway dimensions, see page 1174.

Helical Beam Shaft Couplings

Clamp On

Specially placed beams (cuts) in each of these couplings provide flexibility for parallel, angular, and axial (unless noted) misalignment. The choice for motion-control applications that require precise positioning for frequent starts and stops, they allow zero backlash (no play) and never need lubrication.

Set-screw couplings connect to shafts with four set screws. ***Clamp-on couplings*** connect to shafts via integral shaft collars, which won't damage your shaft. Tighten the two socket-head cap screws to secure.

Aluminum— Couplings are lightweight and corrosion resistant. *Inch-to-inch bore sizes* have a maximum rpm of 10,000. *Metric-to-metric* and *metric-to-inch bore sizes* have a maximum rpm of 6,000. ***Type 303 Stainless Steel—*** Couplings offer excellent corrosion resistance. Maximum rpm is 6,000. ***Acetal—*** Couplings are lightweight and corrosion resistant. Maximum rpm is 5,000. Temp. range is –4° to +140° F.

To Order: Where applicable, please specify bore size (A) and bore size (B) from those available below. *Note:* You can choose any available bore size (A) and any available bore size (B) for a given OD.

Servomotor Double-Disc Shaft Couplings

Able to stand up to high twisting forces with fair misalignment capabilities and zero backlash (no play), these are the couplings you need for servomotor applications. They have lightweight 7075 aluminum clamp hubs and Type 304 stainless steel discs for excellent corrosion resistance. Tighten the two socket-head cap screws to secure. **To Order:** Where applicable, please specify bore size (A) and bore size (B) for those available below. *Note:* You can choose any bore size (A) and bore size (B) for a given OD.

Available Bore Sizes (A)	(B)	Lg.	OD	Bore Depth	Screw Size	Max. Torque, in.-lbs.	Max. rpm	*Maximum Misalignment* Parallel	Angular	Axial		Each

For information about couplings and ANSI keyway dimensions, see page 1174.

High-Offset Slotted-Disc Shaft Couplings

Set-Screw Coupling Shown Assembled

Clamp-On Coupling Shown Assembled

Also known as Oldham couplings, these couplings have a slotted disc that allows hubs to slide independently to compensate for parallel misalignment. They allow zero backlash (no play) and never need lubrication. Maximum rpm is 4,500. For a complete coupling, you need to order two hubs and one disc from the same line in the listing below (for example, 59985K1 hubs are designed to work with either 59985K61 or 59985K91 discs).

Set-screw couplings connect to shafts with two or four alloy steel set screws. ***Clamp-on couplings*** connect to shafts via integral shaft collars, which won't damage your shaft. Tighten the two alloy steel socket-head cap screws to secure.

Hubs— Made of lightweight, corrosion-resistant anodized aluminum, the hubs easily slide out of the disc for quick assembly and disassembly. **To Order:** Please specify bore size from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Acetal Discs— Stand up to high twisting forces. Temp. range is –10° to +150° F.

Nylon Discs— Have excellent vibration and shock absorption. Temp. range is –10° to +130° F.

High-Misalignment Pinhole-Disc Shaft Couplings

Shown Assembled

Also known as Schmidt couplings, these couplings handle three times more angular misalignment than the slotted-disc couplings above. Great for use with encoders, they allow zero backlash (no play) and never need lubrication. For a complete coupling, you need to order two hubs and one disc from the same line in the listing below (for example, two 60635K1 hubs are designed to work with one 60635K86 disc).

Hubs— Made of lightweight, corrosion-resistant aluminum, these hubs connect to shafts via integral shaft collars, which won't damage your shaft. Tighten the two socket-head cap screws to secure. Bore sizes smaller than 1/2" do not have keyways; 1/2" and larger have ANSI keyways (unless noted) for a more secure hold. **To Order:** Please specify bore size from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Discs— Are made of acetal. Temp. range is –40° to +170° F.

COUPLING HUBS							COUPLING DISCS

★ The 1/2" bore size does not have a keyway.

High-Precision Bellows Shaft Couplings

Bellows-shaped one-piece couplings offer great misalignment capabilities for low-torque, high-precision applications such as instrumentation and motion control. They also allow zero backlash (no play) and never need lubrication.

With their nickel bellows and Type 303 stainless steel hubs, these couplings can be used in mildly corrosive environments. Tighten the four black-oxide steel set screws to secure. *Note:* Not rated for max. rpm.

Heavy Duty Bellows Shaft Couplings

If your precision motion-control application requires a high maximum speed, select one of these couplings. They allow zero backlash (no play) and have a weldless construction for durability. They also have clamp-style hubs for superior holding power without damaging your shaft. Tighten the two alloy steel socket-head cap screws to secure.

Couplings have lightweight aluminum hubs and Type 321 stainless steel bellows for corrosion resistance. **To Order:** Where applicable, please specify bore (A) × bore (B) size from those available below.

Available Bore (A) × Bore (B) Size Combinations	Lg.	OD	Bore Depth	Screw Size	Peak Torque, in.-lbs.	Max. rpm	Maximum Misalignment Parallel	Angular	Axial		Each
1/4" × 1/4"	1 5/16"	1"	0.467"	M3	60	10,000	0.004"	1.5°	0.012"	6446K41	$77.69

For information about couplings and ANSI keyway dimensions, see page 1174.

Gear and Sleeve Shaft Couplings

Great for applications with axial misalignment, all of these couplings have ANSI keyways for a more secure hold.

(A) Steel hub and steel sleeve models have a rigid gear design, which allows the most efficient transfer of power available in any coupling. Lubrication is required. To install, heat the hubs to expand them slightly and fit them onto the shaft. When they cool, hubs shrink to fit the shaft tightly so no set screw is needed. For a complete coupling, you need to order two hubs, one sleeve, and a seal kit from the same line in the listing below (for example, two 6454K11 hubs are designed to work with one 6454K21 sleeve and one 6454K31 seal kit). Each *seal kit* includes two Buna-N lubrication seals and two steel snap rings.

(B) Steel hub and nylon sleeve models are compact and lightweight, offering much lower momentum than all-steel couplings. Lubrication is not required. Maximum temperature is 180° F. To install, slide them onto the shaft and tighten the two set screws to secure. For a complete coupling, you need to order two hubs and one sleeve from the same line in the listing below (for example, two 6247K21 hubs are designed to work with one 6247K31 sleeve).

To Order: For hubs, please specify bore size in 1/8″ increments from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Ultra-Flex Double-Loop Shaft Couplings

Large amounts of parallel and angular misalignment are no problem for these couplings because they have a flexible, double-loop polyurethane element with zinc-plated steel hubs. All reduce wear as well as vibration and noise. Temperature range is 0° to 180° F. To secure these couplings to your shaft, tighten the two set screws. **To Order:** Please specify bore (A) × bore (B) size from those available below.

Available Bore (A)×Bore (B) Size Combinations	Lg.	O'all OD	Bore Depth	Screw Size	Peak Torque, in.-lbs.	Max. rpm	Maximum Misalignment Parallel	Angular	Each

Vibration-Dampening Torque-Shear Shaft Couplings

To protect power-transmission components from damage, these single-use couplings shear or tear in over-torque conditions such as when a machine jams. All have steel hubs and a flexible neoprene element that not only compensates for misalignment, but also dampens vibration and shock loads.

Couplings have no metal-on-metal contact, reducing noise and eliminating the need for lubrication. Temperature range is –30° to +212° F. To secure these couplings to your shaft, tighten the two set screws. **To Order:** Where necessary, please specify bore (A) × bore (B) size from those available below.

Available Bore (A)×Bore (B) Size Combinations	Lg.	O'all OD	Bore Depth	Screw Size	Working Torque, in.-lbs.	Max. rpm	Maximum Misalignment Parallel	Angular	Each

Vibration-Dampening Flexible-Tire Shaft Couplings

A flexible tire enables these couplings to provide good parallel and angular misalignment capability, dampen vibration and shock, and handle medium amounts of torque. A complete coupling consists of two hubs, one tire, and two quick-disconnect (QD) bushings from the same line in the listing below (for example 6241K11 hubs are designed to work with a 6241K21 tire and two 6086K11 QD bushings).

Hubs are steel and ductile iron. ***Tires*** are natural rubber. Temp. range is –65° to +180° F.

QD bushings are easy to install and remove. For information on QD bushing styles, see page 1045. **To Order:** Please specify bore size from those available below. *Note:* You can use two QD bushings with different bore sizes in one coupling as long as the QD styles are the same.

O'all Lg.	O'all OD	Working Torque, in.-lbs.	Max. rpm	Maximum Misalignment Parallel	Angular	Axial	Hubs	Each	Tires	Each	QD Bushings Style	Available Bore Sizes	Each

For information about couplings and ANSI keyway dimensions, see page 1174.

Multi-Flex Shaft Couplings

Four-way flexing action means these couplings can take on parallel, angular, and axial misalignment plus dampen vibration and shock. There's no metal-to-metal contact, so there's no need for lubrication. Connect couplings to your shaft via standard ANSI keyways (except where noted) and four set screws. For a complete coupling, you need to order two hubs and one rubber element from the same line in the listing below (for example, 6507K1 hubs are designed to work with the 6507K69 rubber element).

Hubs are sintered steel, unless noted. **To Order:** Please specify bore size in 1/8″ increments from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Rubber elements are gear-shaped, one-piece thermoplastic rubber, unless noted. They allow couplings to accommodate high loads while still offering good flexibility and shock absorption. Temperature range is –30° to +275° F.

Available Bore Sizes	O'all Lg.	Hub OD	Bore Depth	Working Torque, in.-lbs.	Max. rpm	Maximum Misalignment Parallel	Angular	Axial	Hubs	Each	Rubber Elements	Each

♦ 3/8″ bore size does not have a keyway. ● Cast iron. ▲ Two-piece EPDM.

Roller-Chain Shaft Couplings

Rugged, time-tested design allows excellent misalignment and torque capacities. All have ANSI keyways for a more secure hold. Lubrication is required. To secure, tighten the single set screw. For a complete coupling, you need to order two hubs and one roller chain from the same line in the listing below (for example, 6407K41 hubs are designed to work with the 6407K51 roller chain). Complete couplings meet ANSI B29.23M-1995.

Hubs are machined steel with hardened teeth (6407K41 has 12 teeth; K42 and K43 have 16 teeth; K44 has 18 teeth). Set screw size is 1/4″-20 for 1/2″ to 1 1/4″ bores; 5/16″-18 for 1 3/8″ bore; 3/8″-16 for 1 7/16″ to 1 3/4″ bores; 1/2″-13 for 1 7/8″ to 2 1/4″ bores; 5/8″-11 for 2 3/8″ bore. **To Order:** Please specify bore size in 1/8″ increments from those available below. *Note:* You can use two hubs with different bore sizes in one coupling as long as the hub ODs are the same.

Roller chains are steel and are also double stranded. Models 6407K51 and K52 are ANSI No. 40-2; K53 is ANSI No. 50-2; K54 is ANSI No. 60-2.

Optional cover sets retain grease lubrication and provide protection from abrasion and corrosion. They're made of safety-orange nylon.

Available Bore Sizes	O'all Lg.	Hub OD	O'all OD	Bore Depth	Working Torque, in.-lbs.	Max. rpm	Max. Misalignment Parallel	Angular	Hubs	Each	Roller Chains	Each	Optional Cover Sets	Each

Flexible Torque-Limiting Shaft Couplings

These bidirectional couplings disengage at a predetermined torque, sound an alarm, and then automatically re-engage once the over-torque condition is eliminated. Torque can be adjusted ±10% of the factory setting. Max. rpm is 1,800. No lubrication is required.

Couplings have a steel body, aluminum hubs, and ANSI keyways (except for 6609K11, which has no keyway). To secure them to your shaft, tighten the two set screws. **To Order:** Please specify torque: 25, 50, 75, 100, or 125 in.-lbs.

Bore Size	Dia.	Wd.	Max. Misalignment Parallel	Angular		Each

1″	3 1/2″	3″	1/32″	6°	6609K15	90.91

Rigid Torque-Limiting Shaft Couplings

These couplings allow rigid shaft-to-shaft connections with integral over-torque protection. Adjust the torque setting at which couplings will disengage in infinite increments via a hex nut. They'll automatically re-engage once the over-torque condition is eliminated.

Couplings are carbon steel and have ANSI keyways, unless noted. To secure them to your shaft, tighten the single set screw. *Note:* Not rated for max. rpm. **To Order:** Please specify clutch and coupling bore size from those available below.

Available Clutch-End Bore Sizes	Available Coupling-End Bore Sizes	Lg.	Dia.	Working Torque, in.-lbs.		Each

★ 3/4″ bore has a nonstandard 3/64″ keyway.

Coupling and Bearing Guards

Made of rugged safety-orange polyethylene, these OSHA-compliant guards are smooth-edged, electrically nonconductive, and have no mesh for fingers or tools to poke through. All are chemical, corrosion, UV, and impact resistant. They have an OSHA-required enhanced end-cap design and can shield pillow-block bearings from dirt and debris. They meet OSHA standard 29 CFR 1910.219 for rotating machinery. All come unassembled, allowing you to custom fit your application. Type 304 stainless steel hardware included.

Military Specification Pin-and-Block U-Joints with Certification

Designed to MIL-DTL-6193D, Class 2, Type B specifications, these high-precision universal joints come with a certificate of lot traceability. All have bored ends and operate at angles up to 30°, at a max. of 1,000 rpm. They're 4140/4142 alloy steel with an 8620 alloy steel pin and block as well as a silicone boot. To connect to a shaft, drill a hole through the joint and shaft and insert a spring pin (not incl., see pgs. 3323-3329).

♣ 10° angle at 300 rpm.

About U-Joints (Universal Joints)

U-joints connect two spinning shafts that are not aligned.

To choose a U-joint, consider the angle of the shafts, as well as the speed (rpm) and torque the joint will need to transmit. Generally, the more the shafts are offset, the less speed and torque the U-joints will be able to transmit.

Single U-joints compensate for angular offset only. ***Double U-joints*** compensate for angular *and* parallel offset (see diagram).

U-joints are sold without protective lubricant-retaining boots (unless noted). Boots (bellows) are sold on page 3781.

Note: When using two single U-joints, or one double U-joint, the U-joints must be installed at the same angle and the yoke ears must be aligned.

Pin and Block— The simplest design: a block and two pins. They ordinarily provide slower speed but greater torque transmission than needle-bearing units of similar size.

Needle Bearing— Needle bearings reduce side-to-side play (also known as backlash), increasing both precision and rpm capability. These units regularly operate at much higher speeds than the pin-and-block type.

Ball and Socket— Operate smoothly, with no side-to-side play (backlash). Ideal for applications requiring consistent motion and precise control. Generally provide slower speeds than needle-bearing units and lower torque than pin-and-block joints.

Pin-and-Block U-Joints

Simple yet strong, these U-joints are offered with unbored or bored ends. All have boot-retaining grooves (boots are not included) and operate at angles up to 25°, at a maximum of 1,750 rpm.

Unbored ends have a small centered starter hole for easy boring.

To connect U-joints with ***bored ends*** to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329). *Bored ends with keyway and set screw* have a standard ANSI keyway (see page 1174 for ANSI keyway dimensions). *Bored ends* have no keyway or set screw.

Steel U-joints offer mild corrosion resistance. ***Type 303 stainless steel*** U-joints offer excellent corrosion resistance.

Low-Speed Pin-and-Block U-Joints

Die cast zinc U-joints are ideal for hand-powered, low-speed applications.

Joint ends are bored. To connect to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329).

U-joints operate at angles up to 15° and are not rated for maximum rpm.

Bore Dia.	Bore Dp.	Joint Dia.	O'all Lg.	Max. Torque, in.-lbs.		Each

3/4"	7/8"	1 1/8"	3 1/4"	500	6445K6	17.59

Extreme-Angle Pin-and-Block U-Joints

Extra clearance in the yoke allows these U-joints to accommodate angles up to 45°. Heat-treated forged steel yokes and surface-hardened alloy steel pin and block provide durability. A large grease reservoir with lube fitting makes lubrication easy.

Joint ends have a bore. To connect to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329). Maximum rpm is 1,000. Not rated for torque.

3/4"	1 3/8"	1 1/2"	2 1/4"	5 5/8"	6444K32	51.98

For information about U-joints, see page 1183.

Take-Apart Mil. Spec. Pin-and-Block U-Joints

U-joints are simple to take apart so they're more manageable to drill. Ends have a centered starter hole that makes drilling even easier. All (except 2456K15) have a ball-spring oil fitting for lubrication. Max. angle is 35°; max. rpm is 1,500.

Alloy steel joints are 41L40 alloy steel with surface-hardened 86L20 alloy steel pin and block. Yoke ears are hardened for increased strength and durability. Meet MIL-U-20625A, Class A.

Type 303 stainless steel are corrosion and chemical resistant. Yoke ears are not hardened. Meet MIL-U-20625A, Class C.

High-Torque Needle-Bearing U-Joints

Oversized U-joints handle more torque than any other needle-bearing U-joint we offer. Their lube fittings make lubrication easy. U-joints connect to shafts via set screws (included) and a 1/4″ × 1/8″ keyway (unless noted). Maximum rpm is 2,500.

Standard— Max. breaking torque is 10,000 in.-lbs. Max. angle is 45°. Overall length is 5″.

Heavy Duty— Max. breaking torque is 22,000 in.-lbs. Max. angle is 35°. Overall length is 5 1/2″.

High-Speed Compact Needle-Bearing U-Joints

Bored Ends

Booted with Keyway

Needle-bearing U-joints are compact, yet capable of transmitting extremely high speeds. Max. angle is 25° (unless noted); max. rpm is 6,000.

Alloy Steel— Have alloy steel hubs and needle bearings. Joints with *bored ends* do not include a boot; *booted* joints are ungreased with a nitrile boot.

Type 303 Stainless Steel— Have Type 303 stainless steel hubs and steel needle bearings. *Booted* joints are greased and have stainless steel boot bands and a silicone boot; components are corrosion resistant and food grade.

To connect a U-joint with ***bored ends*** to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329). U-joints that are ***booted with keyway*** are ready to install—no machining required. They have a standard ANSI keyway (see page 1174 for dimensions) and come with a set screw.

Corrosion-Resistant Miniature Ball-and-Socket U-Joints

Single

Double

Double Telescoping

These tiny U-joints are made of Type 303 stainless steel and have Type 440 stainless steel balls with sealed-in lubrication. 60075K77 and *K87* have single tapped holes on each end of the joint for size 6-32 set screws (not included); all others have a bore. To connect bored U-joints, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329).

Double-telescoping length can be adjusted from 2 3/4″ to 3″. The center section diameter is 9/16″.

For information about U-joints, see page 1183.

Extreme-Angle Geared U-Joints

A set of meshed gears transmit rotary motion around corners at angles from 3° to 136°. Ideal for most hand-powered, low-speed applications. They have a steel housing and heat-treated steel gears. Gear ratio is 1:1. Joint ends have a bore. To connect to a shaft, drill a hole through the joint and shaft and insert a spring pin (not included, see pages 3323-3329). Max. speed is 600 rpm. Not rated for torque.

Bore Dia.	Bore Dp.	Dia. (A)	Dia. (B)	O'all Lg.		Each
7/16"	1 1/8"	3/4"	2 3/4"	10 1/4"	6450K1	$115.78
1/2"	1 1/8"	3/4"	2 3/4"	10 1/4"	6450K2	118.36
9/16"	1 1/8"	3/4"	2 3/4"	10 1/4"	6450K3	118.36

Flexible Drive Shafts

Need to transmit rotary motion and the path is nowhere near a straight line? Snake these flexible drive shafts around curves and obstructions and your problem's solved. Rotate manually with a knob (not included) or mechanically at speeds up to 200 rpm.

Steel with Female End Fittings— Both ends have female zinc-plated steel end fittings (unless noted) and a set screw. Shafts are steel and operate in clockwise and counterclockwise directions.

Steel with Panel-Mount and Female Fittings— The drive end has a 7/32" diameter shaft (unless noted) with a flat side (see illustration) fitting on one end for attaching to a manual control knob (not included). It's designed for mounting in a panel—just push the drive end of the shaft through a 3/8" hole and secure with included locknuts on both sides of the panel. The other end is a female zinc-plated end fitting with a set screw. Shafts are steel and operate in clockwise and counterclockwise directions. *Note:* Torque is reduced by roughly 30% when operating counterclockwise.

With Female End Fittings

Female

Panel Mount

Type 304 Stainless Steel without End Fittings— Use adhesive to attach. Made of Type 304 stainless steel for superior corrosion resistance. Shafts operate in a clockwise direction.

Type 304 Stainless Steel with Female End Fittings— Both ends have female end fittings and a set screw. Shaft and fittings are made of Type 304 stainless steel for superior corrosion resistance. Shafts operate in a clockwise direction.

♠ Drive end has a 1/4" diameter shaft.

Heavy Duty Flexible Drive Shafts

With a strong carbon steel core, a protective case, and bearings, these rugged shafts handle the demands of high-torque applications easily.

Flexible enough to maneuver over and around obstructions, they correct misalignment, absorb and isolate vibration, and withstand load changes. Shafts operate in clockwise and counterclockwise directions. *Note:* The counterclockwise direction causes a 30% reduction in maximum torque and max. rpm. Maximum temperature is 225° F.

Shafts with bronze sleeve bearings and female end fittings have carbon steel end fittings (with one set screw, unless noted) at each end.

Shafts with steel ball bearings and female end fittings have carbon steel end fittings (with one set screw, unless noted) at each end.

Shafts with bronze sleeve bearings, panel-mount, and female end fittings are designed for mounting in a panel. Just push the drive end of the shaft through a 3/8" hole and secure with the included locknuts. The drive end has a 1/4" diameter and a flat side for fastening to a manual control knob (not included). The other end has a zinc-plated carbon steel female end fitting with a set screw. They operate at speeds up to 200 rpm. Maximum torque is 6.5 in.-lbs.; minimum bend radius is 5".

Push/Pull Control Cables

Snake these flexible cables around obstructions and initiate a push/pull motion from a remote location. Use to operate valves, throttle controls, HVAC damper controls, and much more.

Threaded-mount cables, also known as bulkhead (panel) mount cables, have threaded fittings with two hex nuts and two washers (unless noted) at each end for easy mounting through a panel. You can also remove the nuts and mount with U-bolts or strap clamps (sold separately below). *Grooved-mount* cables have threaded fittings on both ends and a grooved body for mounting with U-bolts or strap clamps (sold separately below).

Standard— Have a high-density polyethylene conduit cover and a steel core (unless noted). End fittings are stainless steel; temperature range is –40° to +210° F.

Corrosion Resistant— Have a slick PTFE casing, a polyethylene conduit cover lined with thermoplastic, and a steel core. End fittings are 300 series stainless steel; temperature range is –65° to +310° F.

Low Friction— Have a unique splined steel core that prevents the cable from twisting during operation. It also limits the number of contact points against the liner to provide extra-smooth, high-efficiency movement. Cables have a high-density polyethylene conduit cover lined with a lubricant impregnated lining. End fittings are stainless steel; temperature range is –40° to +210° F.

High-Capacity Push/Pull Levers handle up to 200 lbs. of dynamic push/pull load. They're made of zinc-plated steel and have a phenolic plastic knob.

Lever and Knob Control Cable Assemblies

Trigger Lever Controlled

Drum Lever Controlled

Knob Controlled—Nonlocking

Knob Controlled—Turn to Lock

Precision Knob Controlled

Conveniently supplied with a lever or knob to initiate push/pull motion (unless noted) from a remote location.

Lever controlled have a zinc-plated steel lever handle that comes attached to a control cable. The cable has a stainless steel core and conduit cover and can be cut to length. Furnished with two 0.209″ mounting holes. Not temperature rated.

Trigger lever controlled have a nylon spring-return trigger attached to a control cable. The cable has a galvanized steel core with a vinyl conduit cover and can be cut to length. Designed to mount to a 3/4″ to 1″ dia. tube or handlebar with a screw (not included; 0.19″ hole dia.). Max. temp. is 250° F.

Drum lever controlled allow you to adjust the friction and the stops (in 3/16″ increments) along the full stroke length. Lever is die cast zinc alloy and can be side or base mounted (base mounting bracket is included) using four 3/16″ mounting holes. Cable has a Type 304 stainless steel core with a polyethylene conduit cover and can be cut to length. Temp. range is –65° to +160° F. Initiates pull motion only.

Knob controlled have a control cable with a Type 302 stainless steel core and a polyethylene conduit cover that can be cut to length. Control knob is phenolic plastic. All can be panel mounted; see table for mounting thread size. Temp. range is –65° to +225° F. *Nonlocking* provides smooth operation. *Turn to lock* is perfect where severe vibration is a concern. Just pull and turn the handle to its locking position. *Precision* has a vernier knob for fine-tuning throttle positions.

About Rod Ends

Rod ends are connectors that support loads and allow motion control. You'll find them in a multitude of applications: steering, tensioning, and controlling movement at pivot points.

Ball Joint Rod Ends (pages 1187-1195)— Have a housing and a ball that swivels to handle angular misalignment. They're also known as rod-end bearings. *Ball-joint linkages* are ball-joint rod ends with studs attached to simplify mounting.

Solid Rod Ends (pages 1196-1198)— Have no moving parts and are designed to handle heavier static loads. Also known as swing bolts and eyebolts, their one-piece body doesn't allow angular misalignment.

Left- and right-hand rod ends (ball joint or solid style) create connections that adjust for tension.

Ball-joint linkages handle misalignment as well as changes in direction.

For technical drawings and 3-D models, go to mcmaster.com.

Ball Joint Rod Ends

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Steel Ball Joint Rod Ends

Our general purpose rod ends will meet your basic connection needs.

Inch sizes have a zinc-plated steel housing and chrome-plated steel ball (unless noted).

Inch sizes with grease fitting are easy to lubricate. Housing is steel. Ball is chrome-plated steel.

Inch sizes with oversized shank have a shank that is one size larger than the ball ID to handle greater stress. Housing is zinc-plated steel. Ball is chrome-plated steel.

Inch sizes with self-lubricating insert have a zinc-plated steel ball that glides on a PTFE-lubricated, carbon-fiber-reinforced plastic insert, which provides wear resistance and doesn't require lubrication. Housing is zinc-plated steel.

Metric sizes have an alloy steel ball. Housing is zinc-plated steel (unless noted).

To Order: Please specify right- or left-hand shank threads.

♦ Right-hand shank threads only. ▲ Machined steel housing and ball. ★ Phosphate-plated bearing steel ball.

For information about rod ends, see page 1187.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

High-Strength Steel Ball Joint Rod Ends

Choose these rod ends for connections that need to handle heavy loads. ***Rod ends with an oversized shank*** have a shank that is one size larger than the ball ID to handle greater stress.

With PTFE-Lined Steel Insert— A PTFE-lined steel insert allows smooth ball rotation and reduces the need for lubrication. Housing is zinc-plated, chromate-treated alloy steel (except 60745K74 and K75 are plain steel) and ball is chrome-plated bearing steel.

With PTFE/Kevlar Insert— A heat-treated, chrome-plated bearing steel ball glides on a durable, self-lubricating, self-sealing PTFE/Kevlar insert. Housing is heat-treated chrome molybdenum steel.

To Order: Please specify right- or left-hand shank threads.

▲ O'all Wd. (B) is 2 3/4".

Stainless Steel Ball Joint Rod Ends

A Type 303 stainless steel housing and Type 440C stainless steel ball provide excellent corrosion resistance while a PTFE liner allows smooth ball rotation and reduces the need for lubrication. ***Rod ends with an oversized shank*** have a shank that is one size larger than the ball ID to handle greater stress.

To Order: Please specify right- or left-hand shank threads.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Metric Stainless Steel Ball Joint Rod Ends

Need excellent corrosion resistance while working with metric components? These rod ends have a Type 303 stainless steel housing and Type 440C stainless steel ball. They also have a PTFE liner that allows smooth ball rotation and reduces the need for lubrication.

To Order: Please specify right- or left-hand shank threads.

Bronze Insert Ball Joint Rod Ends

An oil-impregnated bronze insert reduces the need for lubrication and provides corrosion resistance. All rod ends have a zinc-plated steel housing and a chrome-plated steel ball.

To Order: Please specify right- or left-hand shank threads.

Ultra-Precision Ball Joint Rod Ends

Made to extremely tight tolerances, these rod ends are for applications that require positioning accuracy, such as accelerator and other types of control linkages. They have a chrome-plated bearing steel ball, which is heat treated for added strength, that glides on a brass insert for smooth operation. Housing is zinc-plated steel (except 8286K111 and K311 are plain steel; 6130K11 and K31 are cadmium-plated steel). All have right-hand shank threads.

For information about rod ends, see page 1187.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Corrosion-Resistant Nylon Ball Joint Rod Ends

Made of an impact-resistant nylon composite, these rod ends withstand corrosion as well as fuels, lyes, and weak acids. They are also 80% lighter than steel. A self-lubricating nylon ball ensures low friction and maximum abrasion resistance. Temperature range is −22° to +176° F.

To Order: Please specify right- or left-hand shank threads.

Shank Thread Size	Ball ID (A)	Max. Ball Swivel	O'all Wd. (B)	O'all Thick. (C)	Male-Threaded Shank (D)	Male-Threaded Shank Thread Lg. (E)	Male-Threaded Shank Static Radial Load Cap., lbs. Super-Swivel Ball Joint Rod Ends

With at least 55° of ball swivel, these rod ends accommodate greater misalignment than any other rod end we offer. All have a black-oxide coated, alloy steel housing and a chrome-plated bearing steel ball that are heat treated for added strength. A PTFE liner allows smooth ball rotation and reduces the need for lubrication.

To Order: Please specify right- or left-hand shank threads.

Rod-End Inserts

Attach these adapters to your rod end to move your fastener away from the rod-end body to increase misalignment capabilities.

***High-Misalignment Step-Down Inserts*—** The ID of your rod end is decreased to allow approximately 60° of misalignment. Made of 17-4 PH stainless steel.

***Washer Inserts*—** Also known as retaining safety washers, these inserts protect your rod end and handle some additional misalignment without changing your ball ID. Made of zinc-plated steel.

♣ Available with right-hand thread only.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

High-Speed Mil. Spec. Ball Bearing Rod Ends

A double row of precision ball bearings allows high speeds and smooth operation. All rod ends have a heat-treated, cadmium-plated steel housing; heat-treated bearing steel balls that are packed with grease that meets MIL-PRF-81322G; and a heat-treated, cadmium-plated bearing steel insert. They also have PTFE seals to block contaminants.

Male-threaded rod ends meet MS-21151. ***Female-threaded rod ends*** meet MS-21153. All have right-hand shank threads.

Thrust-Rated Ball Joint Rod Ends

Thanks to an innovative body design that keeps the ball from being pushed out, these rod ends are able to take on thrust (side) loads. All have a zinc-plated steel housing; a steel ball; and an injection-molded, self-lubricating polyurethane insert. Temperature range is –40° to +176° F.

To Order: Please specify right- or left-hand shank threads (unless noted).

♣ Available with right-hand threads.

Tube-End Weld Nuts

Add threads to the ends of tubes to install rod ends. Also known as tube adapters and weldable threaded tube ends, these nuts weld to both mild steel and alloy steel but cannot be welded to coated metal. Nuts are made from alloy steel.

To Order: Please specify right- or left-hand threads.

Seals for Ball Joint Rod Ends

Keep dirt out and lubrication in to extend the life of your rod ends. Seals are nitrile with a stainless steel washer for corrosion resistance. Use them between the head of your rod end and your fastener.

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counterclockwise.

Ball Joint Linkages

Shielded

Bent Swivel

Quick Disconnect

These linkages permit movement and misalignment while allowing adjustment for excess play. Inside each linkage housing you'll find a free-moving ball stud that provides an excellent pivoting connection between light mechanical components and controls. Linkages have a female-threaded shank with right-hand threads (unless noted). They are not load rated.

Steel Linkages— Housing and ball stud are zinc-plated steel.

Stainless Steel Linkages— Housing and ball stud are 300 Series stainless steel for corrosion resistance.

Shielded linkages have a rubber shield that keeps dirt and other contaminants out. ***Bent-swivel linkage*** is lightweight and good for light duty applications. ***Quick-disconnect linkages*** have a retaining sleeve that's easy to disconnect from the ball stud for quick installation.

■ **To Order:** Please specify right- or left-hand shank threads.

Inline Ball Joint Linkages

Without Set Screw

With Set Screw and Nut

Also known as control swivels, these linkages have a "captured" ball with a free-moving ball stud, which provides an excellent pivoting connection between light mechanical components and controls while constraining excess play. Their inline design makes them the choice for linear push applications along the length of a connecting rod.

In addition to a zinc-plated steel housing and ball stud, these linkages have a vibration-dampening rubber disc. Maximum ball swivel is 30°. Temperature range is –60° to +250°F. All have right-hand threads. They are not load rated.

Linkages with set screw and nut have a self-locking set screw and integral nut with lock washer for added holding strength.

Heavy Duty Inline Ball Joint Linkages

Male-Threaded Shank

Female-Threaded Shank

Made to withstand wear, our heavy duty linkages have a polyurethane liner (also known as a boot) that not only keeps out contaminants, but also acts as a cushion to reduce vibration. Use these linkages to compensate for misalignment and to make pivoting connections. The housing and ball stud are made of zinc-plated steel. Maximum ball swivel is 35°. Temperature range is –40° to +176°F. All have right-hand threads. They are not load rated.

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counterclockwise.

Heavy Duty Ball Joint Linkages

Able to stand up to frequent use, these linkages offer superior wear resistance. All are ball joint rod ends with the studs attached to simplify mounting. They have a chrome-plated, bearing-steel ball stud that's machined to fit perfectly inside its housing, which is zinc-plated steel. Linkages are great for clutches, throttles, and shift control rods. Periodic lubrication may be required to keep them operating smoothly. Maximum ball swivel is approximately 50°. They are not load rated.

Linkages with grease fitting are easy to lubricate.

To Order: Please specify right- or left-hand shank threads as well as right- or left-hand stud threads.

Lubrication-Free Heavy Duty Ball Joint Linkages

In addition to superior wear resistance, these linkages have an insert that's designed to eliminate the need for lubrication. All are ball joint rod ends with the studs attached to simplify mounting. They have a ball stud that's machined to fit perfectly inside its housing. Linkages are great for clutches, throttles, and shift control rods. Maximum ball swivel is approximately 50°. They are not load rated.

Lubrication-free linkages have an oil-impregnated bronze insert. Housing is zinc-plated steel. Ball stud is chrome-plated steel.

High-performance lubrication-free linkages have a PTFE-lined, heat-treated steel race; a zinc-plated alloy steel housing; and a chrome-plated, bearing-steel ball stud. Temperature range is –65° to +325° F.

To Order: Please specify right- or left-hand shank threads as well as right- or left-hand stud threads.

Metric Heavy Duty Ball Joint Linkages

Offering strength and durability, these linkages are ball joint rod ends with studs attached to simplify mounting on your metric components. All have a die cast zinc housing and a right-hand threaded steel ball stud. A synthetic rubber dust cover seals the ball joint (which comes packed with lubricant) to keep dirt out. Maximum ball swivel is 34°. Maximum temperature is 176° F. All linkages have a female-threaded shank.

To Order: Please specify right- or left-hand shank threads.

Right-Hand Threaded Connecting Rods

Add rod ends to one of these connecting rods to build a linkage. All have right-hand threads on both ends and are designed to work with right-hand threaded rod ends. Use them for remote valve operators, throttle controllers, shifting mechanisms, and virtually any push/pull assembly. Thread sizes through 5/16″ are zinc-plated steel; 3/8″ and larger are high-strength aluminum.

Easy-Adjust Turnbuckle-Style Threaded Connecting Rods

Similar to turnbuckles, these rods have right-hand threads on one end and left-hand threads on the other so you can make a linkage that adjusts for tension. Add right- and left-handed rod ends to build your linkage. All rods are made of high-strength aluminum. They have a hex-shaped body so you can adjust them with a wrench.

Note: The end with the left-handed threads is marked with a groove.

Thrust-Rated Ball Joint Bearings

With a unique housing (outer ring) and ball (inner ring) design, these bearings are able to support heavy one-direction thrust loads and combination radial/thrust loads. Use them in tight spots where a rod end shank won't fit, or mount them in a drilled hole or a rod end blank (see page 1198). Also known as spherical bearings, each has a bearing steel housing and ball. They require lubrication and are not rated for maximum ball swivel.

Ball Joint Swivel Bearings

Also known as spherical bearings, all of these bearings contain a ball that pivots to accommodate misalignment. Use them in tight spots where a rod end shank won't fit. ***Standard bearings*** require lubrication. ***Lubrication-free bearings*** have a PTFE-lined insert (except bearings with fiber-reinforced plastic housing) and do not require lubrication.

Fiber-Reinforced Plastic Housing— The housing and ball are fiber-reinforced plastic, which is 80% lighter than steel and offers superior corrosion resistance. Temperature range is –22° to +176° F.

Steel Housing with Steel Insert— Have a steel housing and insert with a chrome-plated, bearing steel ball that is heat treated for strength. Temperature range is –65° to +425° F for standard bearings; –65° to +275° F for lubrication-free bearings.

Steel Housing with Bronze Insert— Have a zinc-plated steel housing, nickel-plated steel ball, and oil-impregnated bronze insert to reduce the need for lubrication. Temperature range is –30° to +300° F.

Stainless Steel Housing with Stainless Steel Insert— Offering excellent corrosion resistance, these bearings have a Type 303 stainless steel housing and insert with a Type 440C stainless steel ball that is heat treated for strength. Temperature range is –65° to +425° F for standard bearings; –65° to +275° F for lubrication-free bearings.

Metric Steel Housing with Steel Insert— Have a steel housing and insert with a chrome-plated steel ball. Temperature range is –30° to +300° F.

Extended-Life Ball Joint Swivel Bearings

Specially designed lubrication channels and integral polyester seals allow these bearings to last up to three times longer than other ball joint swivel bearings. Also known as spherical bearings, each has a bearing steel housing, insert, and ball that pivots to accommodate misalignment. Seals keep grease in and contaminants out. Bearings come greased, and can be lubricated through a hole in the housing without removing the load. Maximum temperature is 250° F.

For information about rod ends, see page 1187.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Partially Threaded Solid Rod Ends

Also known as swing bolts and eyebolts, solid rod ends make connections in applications that don't need to compensate for misalignment.

Male Right-Hand Threaded Shank

Steel—Have a black-oxide finish (except 10-32 shank thread size is plain steel). Tensile strength is 75,000 psi. *Metric sizes* meet DIN 444.

Types 303 and 304 Stainless Steel—Offer good corrosion resistance. Tensile strength is 85,000 psi. *Metric sizes* meet DIN 444.

Type 316 Stainless Steel—Offer excellent corrosion resistance. Tensile strength is 80,000 psi.

For information about rod ends, see page 1187.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Fully Threaded Solid Rod Ends

For maximum mounting flexibility, cut the fully threaded shaft to whatever length you need. Also called eyebolts, all of these rod ends have right-hand shank threads.

Steel— Have a black-oxide finish and meet ASTM A521, Class CA (except 10-32 shank thread size). Minimum tensile strength is 60,000 psi.

Alloy Steel— Have a black-oxide finish and meet ASTM A193-B7 (except 10-32 shank thread size). Minimum tensile strength is 125,000 psi.

Stainless Steel— Made of Type 304 stainless steel, these rod ends offer excellent corrosion resistance and meet ASTM A193-B8 (except 10-32 shank thread size). Minimum tensile strength is 75,000 psi.

★ Type 303 stainless steel. ■ Thread length is 3″.

Square-Shoulder Solid Rod Ends

Also known as jig latch bolts, these rod ends mount flush to any flat surface. They're commonly used to mount a workpiece flush to a machining table. All have right-hand shank threads.

Steel— These steel rod ends are heat treated for added strength and have a black-oxide finish. Tensile strength is 78,000 psi.

Stainless Steel— Made of Type 303 stainless steel, these rod ends offer excellent corrosion resistance. Tensile strength is 100,000 psi.

Dimensions

Thread Direction

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counter-clockwise.

Left-Hand Threaded Solid Rod Ends

Create linkages and shaft connections in applications that require left-hand threads. Also called swing bolts and eyebolts, these rod ends are made of steel with a black-oxide finish. Tensile strength is 75,000 psi.

Solid Rod End Blanks

Cut, tap, bore, or weld these rod ends to your exact requirements. They have an unfinished shank and come with a large, centered starter dimple for drilling (except 6147K92, which does not have a dimple).

Steel—Made of C1035 steel. Tensile strength is 75,000 psi.
Alloy Steel—Made of 4140 alloy steel. Tensile strength is 125,000 psi.
Type 304 Stainless Steel—Offer good corrosion resistance. Tensile strength is 85,000 psi.
Type 316 Stainless Steel—Offer excellent corrosion resistance. Tensile strength is 75,000 psi.

Forged Clevis Rod Ends

Make durable pivot-point linkages for shafts, rods, and other assemblies. Also called yoke end linkages, these rod ends are forged for added strength and have female right-hand shank threads. Each comes with a clevis pin and a cotter pin.

Steel—Machined to Society of Automotive Engineers (SAE) standards, unless noted.
Zinc-Plated Steel—Have a corrosion-resistant finish.
Stainless Steel—Made of 300 series stainless steel for good corrosion resistance.

Forged Steel Clevis Rod End Blanks

Thread or weld the unfinished shank of these rod ends to meet your specific linkage needs. Sometimes called yoke end linkages, they're good for making pivot-point linkages for shafts, rods, and other assemblies. All are made of C1018 steel and are forged for added strength. Each comes with a clevis pin and a cotter pin.

Corrosion-Resistant Plastic Clevis Rod Ends

In addition to offering superior corrosion resistance, these lightweight, fiber-reinforced plastic rod ends also reduce noise and vibration. Often called yoke end linkages, they're good for making pivot points for shafts, rods, and other assemblies. All have female right-hand threads. Each comes with a clevis pin and a retaining clip.

Easy-Adapt Clevis Rod Ends

Each rod end has a convenient snap-on spring clevis pin that you can insert and remove by hand. Also known as yoke end linkages, they're good for use as pivot points for shafts, rods, and other assemblies. All are zinc-plated steel and have female right-hand threads.

Male Shank Clevis Rod Ends

A male-threaded shank lets you build a linkage with a tapped tube or other female-threaded connection. Great for a wide variety of pivot-point applications, all are made of zinc-plated steel. Clevis pins are not included, see pages 3352-3355.

To Order: Please specify right- or left-hand shank threads.

Right-hand threaded shank tightens when turned clockwise. This is the most common thread.

Left-hand threaded shank tightens when turned counterclockwise.

Incremental Optical Encoders

Standard Series

When mounted on rotating shafts of motors, conveyors, and measuring wheels, optical encoders convert shaft rotation into square wave output pulses, which are then digitized to indicate position, velocity, and direction. Encoders have a die cast aluminum housing and cover, LED illumination, MS-style (multipole) connector with mating connector, and NEMA 4 and 13 shaft seals. Two synchronized output channels provide reliable directional information. All have a separate index output, unless noted, which provides one measuring step per revolution. Frequency response is 100 kHz. Temp. range is 32° to 158°F.

Compact series has an etched mylar code disc; Type 303 stainless steel shaft; and an M14, 6-pin connector. Current requirement is 100 mA. Output is open collector transistor or line driver, which are interchangeable. Current source is 100 mA. Current sink is 70 mA for open collector transistor; 100 mA for line driver. Supply voltage is 5-28 VDC. Maximum rpm is 8,000.

Standard series has an etched glass code disc; Type 416 stainless steel shaft; and M18, 10-pin connector. Current requirement is 100 mA. Output is line driver. Current source and sink are 100 mA. Supply voltage is 5-15 VDC. Max. rpm is 12,000.

Standard Series Encoder—**To Order:** Please specify resolution from listing above. **59515K11** 686.87

Miniature Incremental Optical Encoders

Hollow Bore

Shaft Mount

Small, easy-to-mount encoders convert mechanical movement into electrical pulses to indicate position, velocity, and direction. All have a black plastic housing, bidirectional rotation, 5-28 VDC input voltage, square wave quadrature output, NPN open collector circuits, and double-shielded ball bearings. Index output provides one measuring step per revolution. Temperature range is –4° to +185°F. Maximum rpm is 8,000. Frequency response is 200 kHz. Current is 65 mA. Sink up to 20 mA current. Furnished with a 36″ long pigtail connection. **To Order:** Please specify resolution (number of measuring steps per revolution): 500; 1,000; 2,000; or 2,500.

Hollow-bore encoders have a built-in flexible mounting bracket—no need for shaft couplings. Two set screws (included) clamp encoder to the rotating shaft. Encoders also have two mounting holes for M3 or 6-32 screws (not included).

Shaft-mount encoder has a Type 303 stainless steel shaft and three tapped M3 x 4.57 mm mounting holes. Fasteners not included.

Cable-Driven Linear-Position Transducers

Compact with Optional Swivel Base

Also known as string pots, these highly accurate transducers measure the relative distance between two points with an extending wire cable. To use, mount the transducer and attach its multistranded wire cable to the movable object. As the object moves, the transducer produces an output voltage that's linearly proportional to the object's movement.

Compact— Small in size and light in weight, these transducers are great for use in tight, dry places. Output signal can be interpreted by a PLC (not included) or the display sold separately below. Transducers have a plastic housing with solder terminal connections and two 5/32″ dia. mounting holes (fasteners not included).

Optional two-axis swivel mounting base allows 360° vertical axis rotation and 245° horizontal axis rotation. Once positioned, you can lock transducer in place on the base using the two included set screws.

Water Resistant— A polycarbonate body with sealed electrical connections and a watertight rubber sheath over the potentiometer make these transducers resistant to water as well as chemicals. All are ready-to-install with an included, easy-to-rotate mounting bracket and 40″ long electrical wire that's already soldered in place. Output signal can be interpreted by a PLC (not included). Transducers have three 1/8″ dia. mounting holes (fasteners not included).

Slimline Rod-Driven Linear-Position Transducers

Pick these rigid transducers to measure the relative distance between two points in extremely compact spaces. All have a short stroke and are lightweight for mobile applications. Their cast nylon body and 300 series stainless steel sealed shaft (to IP66 standards) make them great for harsh environments. Accuracy is 0.15% of full stroke. Repeatability is better than 0.01 mm. Operating temperature range is –22° to +194°F. CE approved.

Digital panel indicator (sold separately) has an IP65, 1/8 DIN case.

Note: For IP rating information, see page 843.

Slam-Preventing Dampers with Ball-Joint Fittings

Put an end to annoying slamming—connect these dampers to lids and doors for smooth, controlled opening and/or closing. As the piston rod is compressed, hydraulic fluid is forced through an internal opening, creating consistent speed throughout the stroke length.

All of these dampers are furnished with the most versatile fittings: ball-joint fittings consisting of a ball socket and ball stud that rotates to compensate for misalignment. You can remove the ball-joint fittings and use any other fittings that have the same rod and end thread size as the damper.

Compression dampers provide a controlled rate of compression, ***extension dampers*** provide a controlled rate of extension, and ***dual-direction dampers*** provide control in both directions.

Fixed-Resistance Dampers— Have an epoxy-coated steel body and a chrome-plated steel piston rod. Temperature range is –40° to +176° F.

Adjustable-Resistance Dampers— Let you achieve the exact amount of resistance you need. Just pull the piston rod out to its fully extended position, then turn the rod left or right to increase or decrease the damping for your application. Dampers have a powder-coated steel body and a ceramic-coated steel piston rod. Temperature range is –22° to +176° F.

Shown with furnished fittings, which can be removed.

Miniature Rotary Dampers

Control the speed of your rotary-motion load in both directions. These dampers allow smooth, quiet, mechanical operation of small lids, doors, and access panels. They're often used in electronics applications.

With Shaft— Maximum cycles per minute is 10. All are polycarbonate with an acetal shaft. Temperature range is 32° to 122° F.

With Square-Insert Opening— These dampers have a square-shaped opening that press-fits onto your shaft. Maximum cycles per minute is 12. All are steel with a nylon square-insert opening. Temperature range is 14° to 122° F.

Miniature Adjustable-Speed Controls

Also known as feed controls, these miniature devices provide steady resistance and precise speed control. They're often used with an air cylinder to control the advance of saw blades, cutters, and drill bits (see the illustration at right). As the piston rod is compressed, hydraulic fluid is forced through an adjustable internal opening, creating consistent velocity control throughout the stroke. You can adjust the speed and force with a simple turn of a knob. An internal spring returns the piston rod to its extended position.

All of these controls have a threaded body and hex jam nut for mounting. The body and bumper are made of steel with a black-oxide finish. Piston rod is Type 440C stainless steel. Temperature range is 32° to 150° F.

About Gas Springs

Gas springs are typically used to assist in opening lids, covers, windows, conveyors, and seats—similar to a hatchback opening on a car. If you want to close an object, you will need a close-assist gas spring (see page 1207).

Note: All gas springs contain pressurized nitrogen gas as well as hydraulic fluid that lubricates the seal and provides slam-resistant damping at the end of the stroke. To avoid loss of force, you should store and install gas springs rod-end down.

Choosing the Right Force

Your gas spring must have enough force to lift your object and hold it open, yet not too much force that you can't push it back to its original position. To determine the right amount of force, you'll need to know the weight of the object you're moving. One way to do this is to use a force or tension gauge (see page 1577).

Estimating Force— If you can't weigh your object, use the following chart to help determine its weight so you can estimate the force you'll need:

Material Weight per Square Foot (12″×12″)			
	Steel	**Aluminum**	**Plastic**
1/16″ Thick.	2.65 lbs.	0.83 lbs.	0.17 lbs.
1/8″ Thick.	5.21 lbs.	1.71 lbs.	0.58 lbs.
1/4″ Thick.	10.46 lbs.	3.61 lbs.	1.10 lbs.

Choosing the Right Extended and Compressed Length

To determine the extended length that's right for your application, open your lid as wide as you need and measure the distance between the two mounting points. For compressed length, close your lid (or lower it to where you need it) and measure the distance between the two mounting points.

A Guide to Choosing the Correct Gas Springs
